

Introduction

Zynq™-7000 All Programmable SoCs are available in -3, -2, and -1 speed grades, with -3 having the highest performance. Zynq-7000 device DC and AC characteristics are specified in commercial, extended, and industrial temperature ranges. Except the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing characteristics of a -1 speed grade industrial device are the same as for a -1 speed grade commercial device). However, only selected speed grades and/or devices are available in the commercial, extended, or industrial temperature ranges.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications.

This Zynq-7000 AP SoC (XC7Z030, XC7Z045, and XC7Z100) data sheet, part of an overall set of documentation on the Zynq-7000 devices, is available on the Xilinx website at www.xilinx.com/zynq. All specifications are subject to change without notice.

Notes:

- Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.

Notes:

- All voltages are relative to ground. The PL and PS share a common ground.
- For the design of the power distribution system consult [UG933](#), *Zynq-7000 All Programmable SoC PCB Design and Pin Planning Guide*.
- When the processor cores operate F_{CPU_6X4X_621_MAX} at 1 GHz (-3E speed grade), the V_{CCPINT} minimum is 0.97V and the V_{CCPINT} maximum is 1.03V.
- Applies to both MIO supply banks V_{CCO_MIO0} and V_{CCO_MIO1}.
- The lower absolute voltage specification always applies.
- Configuration data is retained even if V_{CCO} drops to 0V.
- Includes V_{CCO} of 1.2V, 1.5V, 1.8V, 2.5V, and 3.3V.
- A total of 200 mA per PS or PL bank should not be exceeded.
- V_{CCBATT} is required only when using bitstream encryption. If battery is not used, connect V_{CCBATT} to either ground or V_{CCAUX}.
- Each voltage listed requires the filter circuit described in [UG476](#): *7 Series FPGAs GTX/GTH Transceivers User Guide*.
- For data rates ≤ 10.3125 Gb/s, V_{MGTAVCC} should be 1.0V ±3% for lower power consumption.
- For lower power consumption, V_{MGTAVCC} should be 1.0V ±3% over the entire CPLL frequency range.

Notes:

1. Typical values are specified at nominal voltage, 85°C junction temperatures (T_j) with single-ended SelectIO resources.
2. Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
3. Use the Xilinx Power Estimator (XPE) spreadsheet tool (download at <http://www.xilinx.com/power>) to calculate static power consumption for conditions other than those specified.

PS Power-On/Off Power Supply Requirements

The recommended power-on sequence is V_{CCPINT} , V_{CCPAUX} and V_{CCPLL} together, then the PS V_{CCO} supplies (V_{CCO_MIO0} , V_{CCO_MIO1} , and V_{CCO_DDR}) to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If V_{CCPAUX} , V_{CCPLL} and the PS V_{CCO} supplies (V_{CCO_MIO0} , V_{CCO_MIO1} , and V_{CCO_DDR}) have the same recommended voltage levels, then they can be powered by the same supply and ramped simultaneously. Xilinx recommends powering V_{CCPLL} with the same supply as V_{CCPAUX} , with an optional ferrite bead filter.

For V_{CCO_MIO0} and V_{CCO_MIO1} voltages of 3.3V:

- The voltage difference between $V_{CCO_MIO0}/V_{CCO_MIO1}$ and V_{CCPAUX} must not exceed 2.625V for longer than $T_{VCCO2VCCAUX}$ for each power-on/off cycle to maintain device reliability levels.
- The $T_{VCCO2VCCAUX}$ time can be allocated in any percentage between the power-on and power-off ramps.

PS Power-on Reset

The PS provides the power on reset (PS_POR_B) input signal which must be held Low until all PS power supplies are stable and within operating limits. Additionally, PS_POR_B must be held Low until PS_CLK is stable for 2,000 clocks.

PL Power-On/Off Power Supply Sequencing

The recommended power-on sequence is V_{CCINT} , V_{CCBRAM} , V_{CCAUX} , V_{CCAUX_IO} , and V_{CCO} to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If V_{CCINT} and V_{CCBRAM} have the same recommended voltage levels then both can be powered by the same supply and ramped simultaneously. If V_{CCAUX} , V_{CCAUX_IO} , and V_{CCO} have the same recommended voltage levels then they can be powered by the same supply and ramped simultaneously.

For V_{CCO} voltages of 3.3V in HR I/O banks and configuration bank 0:

- The voltage difference between V_{CCO} and V_{CCAUX} must not exceed 2.625V for longer than $T_{VCCO2VCCAUX}$ for each power-on/off cycle to maintain device reliability levels.
- The $T_{VCCO2VCCAUX}$ time can be allocated in any percentage between the power-on and power-off ramps.

The recommended power-on sequence to achieve minimum current draw for the GTX transceivers is V_{CCINT} , $V_{MGTAVCC}$, $V_{MGTAVTT}$ OR $V_{MGTAVCC}$, V_{CCINT} , $V_{MGTAVTT}$. There is no recommended sequencing for $V_{MGTVCCAUX}$. Both $V_{MGTAVCC}$ and V_{CCINT} can be ramped simultaneously. The recommended power-off sequence is the reverse of the power-on sequence to achieve minimum current draw.

If these recommended sequences are not met, current drawn from $V_{MGTAVTT}$ can be higher than specifications during power-up and power-down.

- When $V_{MGTAVTT}$ is powered before $V_{MGTAVCC}$ and $V_{MGTAVTT} - V_{MGTAVCC} > 150$ mV and $V_{MGTAVCC} < 0.7$ V, the $V_{MGTAVTT}$ current draw can increase by 460 mA per transceiver during $V_{MGTAVCC}$ ramp up. The duration of the current draw can be up to $0.3 \times T_{MGTAVCC}$ (ramp time from GND to 90% of $V_{MGTAVCC}$). The reverse is true for power-down.
- When $V_{MGTAVTT}$ is powered before V_{CCINT} and $V_{MGTAVTT} - V_{CCINT} > 150$ mV and $V_{CCINT} < 0.7$ V, the $V_{MGTAVTT}$ current draw can increase by 50 mA per transceiver during V_{CCINT} ramp up. The duration of the current draw can be up to $0.3 \times T_{VCCINT}$ (ramp time from GND to 90% of V_{CCINT}). The reverse is true for power-down.

PS—PL Power Sequencing

The PS and PL power supplies are fully independent. There are no sequencing requirements between the PS (V_{CCPINT} , V_{CCPAUX} , V_{CCPLL} , V_{CCO_DDR} , V_{CCO_MIO0} , and V_{CCO_MIO1}) and PL (V_{CCINT} , V_{CCBRAM} , V_{CCAUX} , V_{CCO} , V_{CCAUX_IO} , $V_{MGTAVCC}$, $V_{MGTAVTT}$, $V_{MGTVCCAUX}$, and V_{CCADC}) power supplies.

Power Supply and PS Reset Requirements

Table 7 shows the minimum current, in addition to I_{CCQ} , that is required by Zynq-7000 devices for proper power-on and configuration. If the current minimums shown in Table 6 and Table 7 are met, the device powers on after all five supplies have passed through their power-on reset threshold voltages. The Zynq-7000 device must not be configured until after V_{CCINT} is applied. Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

DC Input and Output Levels

Values for V_{IL} and V_{IH} are recommended input voltages. Values for I_{OL} and I_{OH} are guaranteed over the recommended operating conditions at the V_{OL} and V_{OH} test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum V_{CCO} with the respective V_{OL} and V_{OH} voltage levels shown. Other standards are sample tested.

AC Switching Characteristics

All values represented in this data sheet are based on the speed specifications in ISE® Design Suite 14.5 v1.06 and Vivado® Design Suite 2013.1 v1.06 for the -3, -2, and -1 speed grades.

Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

Advance Product Specification

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

Preliminary Product Specification

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

Production Product Specification

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

Testing of AC Switching Characteristics

Internal timing parameters are derived from measuring internal test patterns. All AC switching characteristics are representative of worst-case supply voltage and junction temperature conditions.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Zynq-7000 devices.

Speed Grade Designations

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 16](#) correlates the current status of each Zynq-7000 device on a per speed grade basis.

Table 16: Zynq-7000 Device Speed Grade Designations

Device	Speed Grade Designations		
	Advance	Preliminary	Production
XC7Z030		-3, -2, -1	
XC7Z045		-3	-2, -1
XC7Z100		-2, -1	

Production Silicon and Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases.

Table 17 lists the production released Zynq-7000 device, speed grade, and the minimum corresponding supported speed specification version and ISE software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

PL Performance Characteristics

This section provides the performance characteristics of some common functions and designs implemented in the PL. The numbers reported here are worst-case values; they have all been fully characterized. These values are subject to the same guidelines as the [AC Switching Characteristics, page 13](#). In each table, the I/O bank type is either High Performance (HP) or High Range (HR).

Table 49: PL Networking Applications Interface Performances

Description	I/O Bank Type	Speed Grade			Units
		-3	-2	-1	
SDR LVDS transmitter (using OSERDES; DATA_WIDTH = 4 to 8)	HR	710	710	625	Mb/s
	HP	710	710	625	Mb/s

Notes:

1. V_{REF} tracking is required. For more information, see [UG586](#), *7 Series FPGAs Memory Interface Solutions User Guide*.
2. When using the internal V_{REF} the maximum data rate is 800 Mb/s (400 MHz).
3. RLDRAM III (BL = 4, BL = 8) and LPDDR2 specifications have not been validated with memory IP.
4. The maximum QDRII+ performance specifications are for burst-length 4 (BL = 4) implementations. Burst length 2 (BL = 2) implementations are limited to 333 MHz for all speed grades and I/O bank types.

2. When using the internal V_{REF} the maximum data rate is 800 Mb/s (400 MHz).
3. FBG packages do not have separate V_{CCAUX_IO} supply pins to adjust the pre-driver voltage of the HP I/O banks.
4. RLDRAM III (BL = 4, BL = 8) and LPDDR2 specifications have not been validated with memory IP.
5. The maximum QDRII+ performance specifications are for burst-length 4 (BL = 4) implementations. Burst length 2 (BL = 2) implementations are limited to 333 MHz for all speed grades and I/O bank types.

PL Switching Characteristics

IOB Pad Input/Output/3-State

Table 52 (3.3V high-range IOB (HR)) and Table 53 (1.8V high-performance IOB (HP)) summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

- T_{IOPI} is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- T_{IOOP} is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- T_{IOTP} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer. In HP I/O banks, the internal DCI termination turn-on time is always faster than T_{IOTP} when the DCITERMDISABLE pin is used. In HR I/O banks, the IN_TERM termination turn-on time is always faster than T_{IOTP} when the INTERMDISABLE pin is used.

Notes:

1. This I/O standard is only available in the 1.8V high-performance (HP) banks.

Table 54 specifies the values of T_{IOTPHZ} and T_{IOIBUFDISABLE}. T_{IOTPHZ} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state). T_{IOIBUFDISABLE} is described as the IOB delay from IBUFDISABLE to O output. In HP I/O banks, the internal DCI termination turn-off time is always faster than T_{IOTPHZ} when the DCITERMDISABLE pin is used. In HR I/O banks, the internal IN_TERM termination turn-off time is always faster than T_{IOTPHZ} when the INTERMDISABLE pin is used.

Notes:

- TRACE will report all of these parameters as T_{RCKO_DO} .
- T_{RCKO_DOR} includes T_{RCKO_DOW} , T_{RCKO_DOPR} , and T_{RCKO_DOPW} as well as the B port equivalent timing parameters.
- These parameters also apply to synchronous FIFO with $DO_REG = 0$.
- T_{RCKO_DO} includes T_{RCKO_DOP} as well as the B port equivalent timing parameters.
- These parameters also apply to multirate (asynchronous) and synchronous FIFO with $DO_REG = 1$.
- T_{RCKO_FLAGS} includes the following parameters: T_{RCKO_AEMPTY} , T_{RCKO_AFULL} , T_{RCKO_EMPTY} , T_{RCKO_FULL} , T_{RCKO_RDERR} , T_{RCKO_WRERR} .
- $T_{RCKO_POINTERS}$ includes both $T_{RCKO_RDCOUNT}$ and $T_{RCKO_WRCOUNT}$.
- The ADDR setup and hold must be met when EN is asserted (even when WE is deasserted). Otherwise, block RAM data corruption is possible.
- These parameters include both A and B inputs as well as the parity inputs of A and B.
- T_{RCKO_FLAGS} includes the following flags: AEMPTY, AFULL, EMPTY, FULL, RDERR, WRERR, RDCOUNT, and WRCOUNT.
- RDEN and WREN must be held Low prior to and during reset. The FIFO reset must be asserted for at least five positive clock edges of the slowest clock (WRCLK or RDCLK).

$T_{BCCCK_S}/T_{BCCCK_S}^{(1)}$	S pins setup/hold	0.12/0.30	0.14/0.38	0.26/0.38	ns
$T_{BCCCKO_O}^{(2)}$	BUFCTRL delay from I/O to O	0.08	0.10	0.12	ns
Maximum Frequency					
F_{MAX_BUFG}	Global clock tree (BUFG)	741.00	710.00	625.00	MHz

Notes:

- T_{BCCCK_CE} and T_{BCCCK_S} must be satisfied to assure glitch-free operation of the global clock when switching between clocks. These parameters do not apply to the BUFMUX primitive that assures glitch-free operation. The other global clock setup and hold times are optional; only needing to be satisfied if device operation requires simulation matches on a cycle-for-cycle basis when switching between clocks.
- T_{BCCCKO_O} (BUFG delay from I/O to O) values are the same as T_{BCCCKO_O} values.

T _{CKSKEW}	Global clock tree skew ⁽²⁾	XC7Z030	0.29	0.36	0.37	ns
		XC7Z045	0.43	0.54	0.57	ns
		XC7Z100				ns
T _{DCD_BUFIO}	I/O clock tree duty-cycle distortion	All	0.12	0.12	0.12	ns
T _{BUFIOSKEW}	I/O clock tree skew across one clock region	All	0.02	0.02	0.02	ns
T _{DCD_BUFRR}	Regional clock tree duty-cycle distortion	All	0.15	0.15	0.15	ns

Notes:

1. These parameters represent the worst-case duty-cycle distortion observable at the pins of the device using LVDS output buffers. For cases where other I/O standards are used, IBIS can be used to calculate any additional duty-cycle distortion that might be caused by asymmetrical rise/fall times.
2. The T_{CKSKEW} value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx Timing Analyzer tools to evaluate application specific clock skew.

Notes:

1. The MMCM does not filter typical spread-spectrum input clocks because they are usually far below the bandwidth filter frequencies.
2. The static offset is measured between any MMCM outputs with identical phase.
3. Values for this parameter are available in the Clocking Wizard.
See http://www.xilinx.com/products/intellectual-property/clocking_wizard.htm.
4. Includes global clock buffer.
5. Calculated as $F_{VCO}/128$ assuming output duty cycle is 50%.
6. When CLKOUT4_CASCADE = TRUE, MMCM_F_{OUTMIN} is 0.036 MHz.

Notes:

- This parameter indicates the total sampling error of the PL DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include:
 - CLK0 MMCM jitter
 - MMCM accuracy (phase offset)
 - MMCM phase shift resolution
 These measurements do not include package or clock tree skew.
- This parameter indicates the total sampling error of the PL DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFIO clock network and IDELAY to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.

Additional Package Parameter Guidelines

The parameters in this section provide the necessary values for calculating timing budgets for PL clock transmitter and receiver data-valid windows.

Table 83: Package Skew

Symbol	Description	Device	Package	Value	Units
T _{PKGSKEW}	Package skew ⁽¹⁾	XC7Z030	FBG484	113	ps
			FBG676	113	ps
			FFG676	136	ps
		XC7Z045	FBG676	159	ps
			FFG676	158	ps
			FFG900	191	ps
		XC7Z100	FFG900		ps
FFG1156			ps		

Notes:

- These values represent the worst-case skew between any two SelectIO resources in the package: shortest delay to longest delay from die pad to ball.
- Package delay information is available for these device/package combinations. This information can be used to deskew the package.

GTX Transceiver Specifications

GTX Transceiver DC Input and Output Levels

Table 84 summarizes the DC specifications of the GTX transceivers in Zynq-7000 devices. Consult [UG476: 7 Series FPGAs GTX/GTH Transceivers User Guide](#) for further details.

Notes:

- Using same REFCLK input with TX phase alignment enabled for up to 12 consecutive transmitters (three fully populated GTX Quads).
- Using QPLL_FBDIV = 40, 20-bit internal data width. These values are NOT intended for protocol specific compliance determinations.
- Using CPLL_FBDIV = 2, 20-bit internal data width. These values are NOT intended for protocol specific compliance determinations.
- All jitter values are based on a bit-error ratio of $1e^{-12}$.
- CPLL frequency at 3.2 GHz and TXOUT_DIV = 2.
- CPLL frequency at 1.6 GHz and TXOUT_DIV = 1.
- CPLL frequency at 2.5 GHz and TXOUT_DIV = 2.
- CPLL frequency at 2.5 GHz and TXOUT_DIV = 4.

Notes:

- Offset and gain errors are removed by enabling the XADC automatic gain calibration feature. The values are specified for when this feature is enabled.
- Only specified for new BitGen option XADCEnhancedLinearity = ON.
- See the ADC chapter in [UG480: 7 Series FPGAs XADC User Guide](#) for a detailed description.
- See the Timing chapter in [UG480: 7 Series FPGAs XADC User Guide](#) for a detailed description.
- Any variation in the reference voltage from the nominal $V_{REFP} = 1.25\text{V}$ and $V_{REFN} = 0\text{V}$ will result in a deviation from the ideal transfer function. This also impacts the accuracy of the internal sensor measurements (i.e., temperature and power supply). However, for external ratiometric type applications allowing reference to vary by $\pm 4\%$ is permitted. On-chip reference variation is $\pm 1\%$.

Revision History

The following table shows the revision history for this document:

Date	Version	Description
08/23/2012	1.0	Initial Xilinx release.
08/31/2012	1.1	Updated T_j and added Note 3 to Table 2 . Updated R_{IN_TERM} in Table 3 . Updated standards in Table 9 . Revised PS Performance Characteristics section introduction. Updated values in Table 18 . Added Note 3 to Table 32 . Added notes to Table 34 . Revised $F_{MSPICLK}$ in Table 39 .
03/14/2013	1.2	Updated the AC Switching Characteristics based upon ISE 14.5 and Vivado 2013.1, both at v1.06 for the -3, -2, and -1 speed specifications throughout the document. Updated Table 16 and Table 17 for production release of the XC7Z045 in the -2 and -1 speed designations. Added the XC7Z100 device throughout document. Updated description in Introduction . Added Note 2 to Table 2 . Updated V_{PIN} in Table 1 and Table 2 . Clarified PS specifications for $C_{PIN}(2)$ and removed Note 3 on I_{RPD} in Table 3 . Updated Table 6 . Updated Table 9 , including removal of LVTTTL, notes 2 and 3, and adding SSTL135. Added Table 10 . Many enhancements and additions to the figures and tables in the PS Switching Characteristics section including adding notes with test conditions where applicable. Replaced or updated Table 18 through Table 48 . Removed AXI Interconnects section. Updated Note 1 in Table 68 . Updated Note 1 and Note 2 in Table 83 . In Table 86 , increased -1 speed grade (FF package) F_{GTXMAX} value from 6.6 Gb/s to 8.0 Gb/s. Updated the rows on offset error and gain error and matching in Table 100 . Added Internal Configuration Access Port section to Table 101 .
