

Features

- **SuperFAST HIGH DENSITY IN-SYSTEM PROGRAMMABLE LOGIC**
 - 6000 PLD Gates
 - 128 and 64 I/O Pin Versions, Eight Dedicated Inputs
 - 128 Registers
 - High Speed Global Interconnect
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Random Logic
 - 100% Functional, JEDEC and Pinout Compatible with ispLSI 2128V Devices
- **3.3V LOW VOLTAGE 2128 ARCHITECTURE**
 - Interfaces with Standard 5V TTL Devices
 - 128 I/O Pin Version is Fuse Map Compatible with 5V ispLSI® 2128 and 2128E
- **HIGH PERFORMANCE E²CTMOS TECHNOLOGY**
 - $f_{max} = 180$ MHz Maximum Operating Frequency
 - $t_{pd} = 5.0$ ns Propagation Delay
 - Electrically Erasable and Reprogrammable
 - Non-Volatile
 - 100% Tested at Time of Manufacture
 - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
 - 3.3V In-System Programmability (ISP™) Using Boundary Scan Test Access Port (TAP)
 - Open-Drain Output Option for Flexible Bus Interface Capability, Allowing Easy Implementation of Wired-OR Bus Arbitration Logic
 - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
 - Reprogram Soldered Devices for Faster Prototyping
- **100% IEEE 1149.1 BOUNDARY SCAN TESTABLE**
- **THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FPGAs**
 - Enhanced Pin Locking Capability
 - Three Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Programmable Output Slew Rate Control
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispEXPERT™ – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
 - Superior Quality of Results
 - Tightly Integrated with Leading CAE Vendor Tools
 - Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and IspANALYZER™
 - PC and UNIX Platforms

Functional Block Diagram*

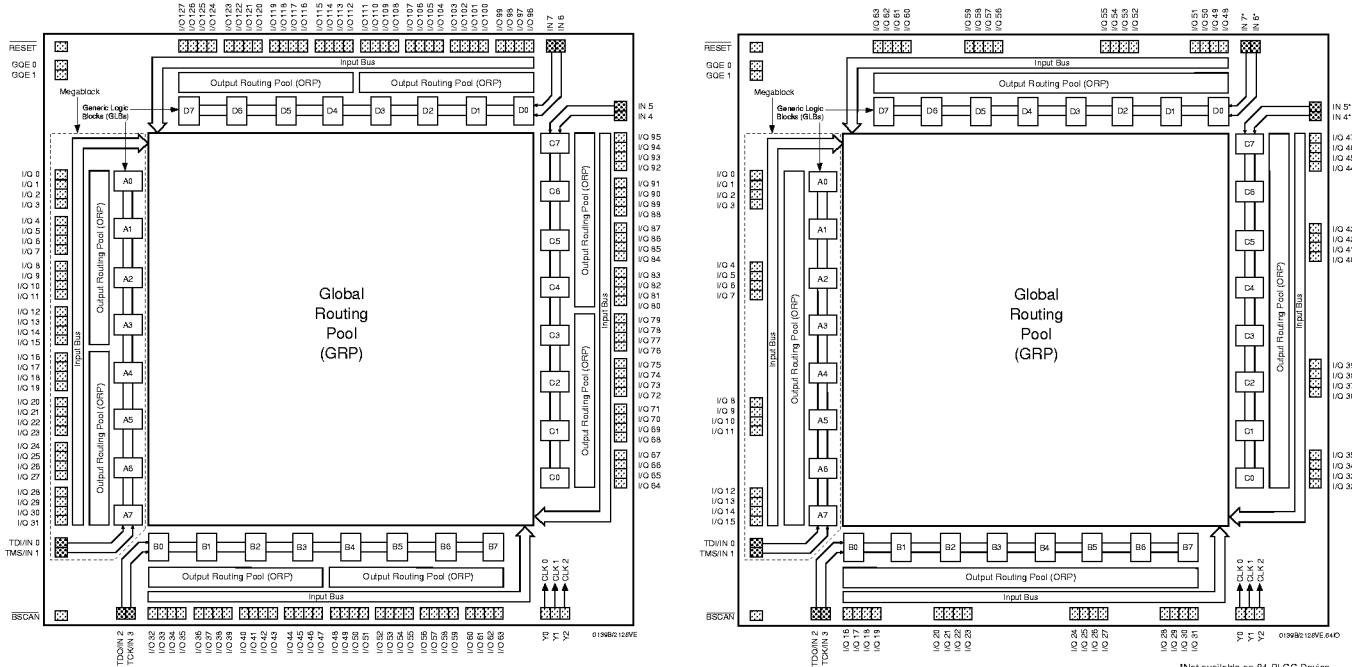

Description

The ispLSI 2128VE is a High Density Programmable Logic Device available in 128 and 64 I/O-pin versions. The device contains 128 Registers, eight Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2128VE features in-system programmability through the Boundary Scan Test Access Port (TAP) and is 100% IEEE 1149.1 Boundary Scan Testable. The ispLSI 2128VE offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 2128VE device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. D7 (see Figure 1). There are a total of 32 GLBs in the ispLSI 2128VE device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. ispLSI 2128VE Functional Block Diagram (128-I/O and 64-I/O Versions)

*Not available on 84-PLCC Device

The 128-I/O 2128VE contains 128 I/O cells, while the 64-I/O version contains 64 I/O cells. Each I/O cell is directly connected to an I/O pin and can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4mA or sink 8mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. Device pins can be safely driven to 5V signal levels to support mixed-voltage systems.

Eight GLBs, 32 or 16 I/O cells, two dedicated inputs and two or one ORPs are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 32 or 16 universal I/O cells by the two or one ORPs. Each ispLSI 2128VE device contains four Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2128VE device are selected using the dedicated clock pins. Three dedicated clock pins (Y_0 ,

Y_1 , Y_2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI 2128VE are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified V_{OH} and V_{OL} levels, whereas the open-drain output drives only the specified V_{OL} . The V_{OH} level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the ispEXPERT software tools.

Absolute Maximum Ratings¹

Supply Voltage V _{CC}	-0.5 to +5.4V
Input Voltage Applied	-0.5 to +5.6V
Off-State Output Voltage Applied	-0.5 to +5.6V
Storage Temperature	-65 to 150°C
Case Temp. with Power Applied	-55 to 125°C
Max. Junction Temp. (T _J) with Power Applied ...	150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

SYMBOL	PARAMETER		MIN.	MAX.	UNITS
V_{CC}	Supply Voltage	Commercial T _A = 0°C to +70°C	3.0	3.6	V
		Industrial T _A = -40°C to +85°C	3.0	3.6	V
V_{IL}	Input Low Voltage		V _{SS} - 0.5	0.8	V
V_{IH}	Input High Voltage		2.0	5.25	V

Table 2-0005/2128VE

Capacitance (T_A=25°C, f=1.0 MHz)

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
C₁	Dedicated Input Capacitance	8	pf	V _{CC} = 3.3V, V _{IN} = 0.0V
C₂	I/O Capacitance	6	pf	V _{CC} = 3.3V, V _{I/O} = 0.0V
C₃	Clock and Global Output Enable Capacitance	10	pf	V _{CC} = 3.3V, V _Y = 0.0V

Table 2-0006/2128VE

Erase Reprogram Specifications

PARAMETER	MINIMUM	MAXIMUM	UNITS
Erase/Reprogram Cycles	10,000	–	Cycles

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION	MIN.	TYP. ³	MAX.	UNITS
V_{OL}	Output Low Voltage	$I_{OL}= 8 \text{ mA}$	—	—	0.4	V
V_{OH}^5	Output High Voltage	$I_{OH} = -4 \text{ mA}$	2.4	—	—	V
I_{IL}	Input or I/O Low Leakage Current	$0\text{V} \leq V_{IN} \leq V_{IL} (\text{Max.})$	—	—	-10	μA
I_{IH}	Input or I/O High Leakage Current	$(V_{CC} - 0.2)\text{V} \leq V_{IN} \leq V_{CC}$	—	—	10	μA
		$V_{CC} \leq V_{IN} \leq 5.25\text{V}$	—	—	10	μA
I_{IL-isp}	BSCAN Input Low Leakage Current	$0\text{V} \leq V_{IN} \leq V_{IL}$	—	—	-150	μA
I_{IL-PU}	I/O Active Pull-Up Current	$0\text{V} \leq V_{IN} \leq V_{IL}$	—	—	-150	μA
I_{OS}^1	Output Short Circuit Current	$V_{CC} = 3.3\text{V}$, $V_{OUT} = 0.5\text{V}$	—	—	-100	mA
$I_{CC}^{2, 4}$	Operating Power Supply Current	$V_{IL} = 0.0\text{V}$, $V_{IH} = 3.0\text{V}$ $f_{CLOCK} = 1 \text{ MHz}$	—	180	—	mA

- One output at a time for a maximum duration of one second. $V_{OUT} = 0.5\text{V}$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.

2. Measured using eight 16-bit counters.

3. Typical values are at $V_{CC} = 3.3\text{V}$ and $T_A = 25^\circ\text{C}$.

4. Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

5. External pull-ups on I/Os configured as outputs must be tied to 3.3V V_{CC} .

 &= (\#20 + \#22 + \#35) + (\#31) + (\#36 + \#38) \\
 8.4\text{ns} &= (0.5 + 0.6 + 4.0) + (0.3) + (1.4 + 1.6)
 \end{aligned}$$

Note: Calculations are based upon timing specifications for the ispLSI 2128VE-180L.

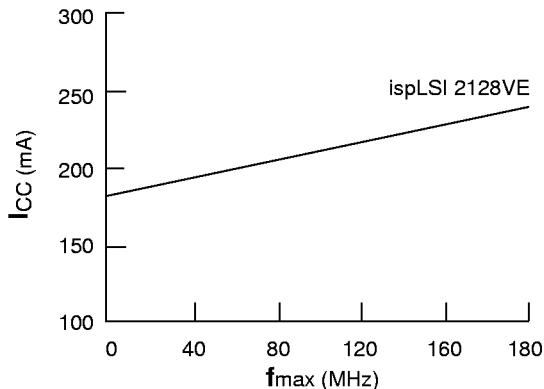

Table 2-0042/2128VE

Power Consumption

Power consumption in the ispLSI 2128VE device depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of eight 16-bit counters
Typical current at 3.3V, 25° C

I_{CC} can be estimated for the ispLSI 2128VE using the following equation:

$$I_{CC} = 7 + (\# \text{ of PTs} * 0.698) + (\# \text{ of nets} * \text{max freq} * 0.0011)$$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions ($V_{CC} = 3.3V$, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

0127/2128VE

Signal Descriptions

Signal Name	Description
RESET	Active Low (0) Reset pin resets all the registers in the device.
GOE 0, GOE1	Global Output Enable input pins.
Y0, Y1, Y2	Dedicated Clock Input – These clock inputs are connected to one of the clock inputs of all the GLBs in the device.
BSCAN	Input – Dedicated in-system programming Boundary Scan enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active.
TDI/IN 0	Input – This pin performs two functions. When BSCAN is logic low, it functions as a serial data input pin to load programming data into the device. When BSCAN is high, it functions as a dedicated input pin.
TCK/IN 3	Input – This pin performs two functions. When BSCAN is logic low, it functions as a clock pin for the ISP/Boundary Scan state machine. When BSCAN is high, it functions as a dedicated input pin.
TMS/IN 1	Input – This pin performs two functions. When BSCAN is logic low, it functions as a mode control pin for the ISP/Boundary Scan state machine. When BSCAN is high, it functions as a dedicated input pin.
TDO/IN 2	Output/Input – This pin performs two functions. When BSCAN is logic low, it functions as an output pin to read serial shift register data. When BSCAN is high, it functions as a dedicated input pin.
IN 4 - IN 7	Dedicated Input Pins to the device.
GND	Ground (GND)
VCC	Vcc
NC ¹	No Connect
I/O	Input/Output Pins – These are the general purpose I/O pins used by the logic array.

1. NC pins are not to be connected to any active signals, VCC or GND.
