

# Automotive ProASIC3 Flash Family FPGAs

## Features and Benefits

### Extended Temperature AEC-Q100–Qualified Devices

- Grade 2: –40°C to 105°C T<sub>A</sub> (115°C T<sub>J</sub>)
- Grade 1: –40°C to 125°C T<sub>A</sub> (135°C T<sub>J</sub>)
- PPAP Documentation

### Firm-Error Immune

- Only Automotive FPGAs to Offer Firm-Error Immunity
- Can Be Used without Configuration Upset Risk

### High Capacity

- 60 k to 1 M System Gates
- Up to 144 kbits of SRAM
- Up to 300 User I/Os

### Reprogrammable Flash Technology

- 130-nm, 7-Layer Metal (6 Copper), Flash-Based CMOS Automotive Process
- Live-at-Power-Up (LAPU) Level 0 Support
- Single-Chip Solution
- Retains Programmed Design when Powered Off

### On-Chip User Nonvolatile Memory

- 1 kbit of FlashROM with Synchronous Interface

### High Performance

- 350 MHz System Performance
- 3.3 V, 66 MHz 64-Bit PCI

### In-System Programming (ISP) and Security

- ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532–compliant)
- FlashLock<sup>®</sup> Designed to Provide High-Level Security for FPGA Contents (anti-tampering)

### Low Power

- 1.5 V Core Voltage
- Support for 1.5-V-Only Systems
- Low-Impedance Flash Switches

### High-Performance Routing Hierarchy

- Segmented, Hierarchical Routing and Clock Structure
- High-Performance, Low-Skew Global Network
- Architecture Supports Ultra-High Utilization

### Advanced I/O

- 700 Mbps DDR, LVDS-Capable I/Os
- 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation
- Bank-Selectable I/O Voltages—up to 4 Banks per Chip
- Single-Ended I/O Standards: LVTTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V, 3.3 V PCI / 3.3 V PCI-X, and LVCMOS 2.5 V / 5.0 V Input
- Differential I/O Standards: LVPECL, LVDS, B-LVDS, and M-LVDS (A3P250 and A3P1000)
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os
- Programmable Output Slew Rate and Drive Strength
- Weak Pull-Up/-Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Packages across the Automotive ProASIC<sup>®</sup>3 Family

### Clock Conditioning Circuit (CCC) and PLL

- Six CCC Blocks, One with an Integrated PLL
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range (1.5 MHz up to 350 MHz)

### SRAMs

- Variable-Aspect-Ratio 4,608-Bit RAM Blocks (x1, x2, x4, x9, and x18 organizations available)

**Table 1 • Automotive ProASIC3 Product Family**

ProASIC3 Devices	A3P060	A3P125	A3P250	A3P1000
System Gates	60 k	125 k	250 k	1 M
VersaTiles (D-flip-flops)	1,536	3,072	6,144	24,576
RAM kbits (1,024 bits)	18	36	36	144
4,608-Bit Blocks	4	8	8	32
FlashROM Bits	1 k	1 k	1 k	1 k
Secure (AES) ISP	Yes	Yes	Yes	Yes
Integrated PLL in CCCs	1	1	1	1
VersaNet Globals <sup>1</sup>	18	18	18	18
I/O Banks	2	2	4	4
Maximum User I/Os	96	133	157	300
Package Pins				
VQFP	VQ100	VQ100	VQ100	
FBGA	FG144	FG144	FG144, FG256	FG144, FG256, FG484
QFN <sup>2</sup>		QNG132	QNG132	

**Notes:**

1. Six chip-wide (main) globals and three additional global networks in each quadrant are available.
2. QFN packages are available as RoHS compliant only.

## I/Os Per Package

ProASIC3 Devices	A3P060	A3P125	A3P250		A3P1000	
Package	I/O Type					
	Single-Ended I/O	Single-Ended I/O	Single-Ended I/O <sup>2</sup>	Differential I/O Pairs	Single-Ended I/O <sup>2</sup>	Differential I/O Pairs
VQ100	71	71	68	13	–	–
FG144	96	97	97	24	97	25
FG256	–	–	157	38	177	44
FG484	–	–	–	–	300	74
QNG132	–	84	87	19	–	–

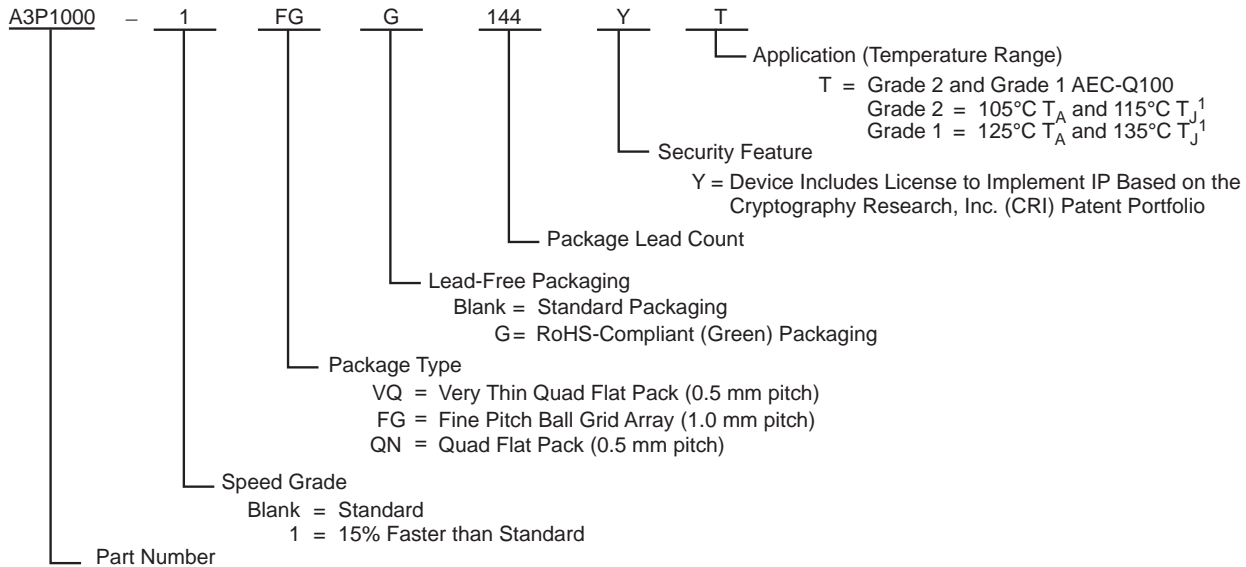

**Notes:**

1. When considering migrating your design to a lower- or higher-density device, refer to the [ProASIC3 FPGA Fabric User's Guide](#) to ensure complying with design and board migration requirements.
2. Each used differential I/O pair reduces the number of available single-ended I/Os by two.
3. FG256 and FG484 are footprint-compatible packages.

## Automotive ProASIC3 Device Status

Automotive ProASIC3 Devices	Status
A3P060	Production
A3P125	Production
A3P250	Production
A3P1000	Production

# Automotive ProASIC3 Ordering Information

**Automotive ProASIC3 Devices**

- A3P060 = 60,000 System Gates
- A3P125 = 125,000 System Gates
- A3P250 = 250,000 System Gates
- A3P1000 = 1,000,000 System Gates

**Notes:**

1. T<sub>A</sub> = Ambient temperature and T<sub>J</sub> = Junction temperature.
2. Minimum order quantities apply. Contact your local Microsemi SoC Products Group sales office for details.

## Temperature Grade Offerings

Package	A3P060	A3P125	A3P250	A3P1000
VQ100	C, I, T	C, I, T	C, I, T	–
FG144	C, I, T	C, I, T	C, I, T	C, I, T
FG256	–	–	C, I, T	C, I, T
FG484	–	–	–	C, I, T
QNG132	–	C, I, T	C, I, T	–

**Notes:**

1. C = Commercial temperature range: 0°C to 70°C
2. I = Industrial temperature range: –40°C to 85°C
3. T = Automotive temperature range: Grade 2 and Grade 1 AEC-Q100  
 Grade 2 = 105°C  $T_A$  and 115°C  $T_J$   
 Grade 1 = 125°C  $T_A$  and 135°C  $T_J$
4. Specifications for Commercial and Industrial grade devices can be found in the ProASIC3 Flash Family FPGAs datasheet.

## Speed Grade and Temperature Grade Matrix

Temperature Grade	Std.	–1
T (Grade 1 and Grade 2), Commercial, Industrial	✓	✓

**Notes:**

1. T = Automotive temperature range: Grade 2 and Grade 1 AEC-Q100  
 Grade 2 = 105°C  $T_A$  and 115°C  $T_J$   
 Grade 1 = 125°C  $T_A$  and 135°C  $T_J$
2. Specifications for Commercial and Industrial grade devices can be found in the ProASIC3 Flash Family FPGAs datasheet.

# 1 – Automotive ProASIC3 Device Family Overview

---

## General Description

Automotive ProASIC3 nonvolatile flash technology gives automotive system designers the advantage of a secure, low-power, single-chip solution that is live at power-up (LAPU). Automotive ProASIC3 is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost. These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

Automotive ProASIC3 devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on an integrated phase-locked loop (PLL). Automotive ProASIC3 devices have up to 1 million system gates, supported with up to 144 kbits of SRAM and up to 300 user I/Os.

Automotive ProASIC3 devices are the only firm-error-immune automotive grade FPGAs. Firm-error immunity makes them ideally suited for demanding applications in powertrain, safety, and telematics-based subsystems, where firm-error failure is not an option.

Firm errors in SRAM-based FPGAs can result in high defect levels in field-deployed systems. These unavoidable defects must be considered separately from standard defects and failure mechanisms when looking at overall system quality and reliability.

## Flash Advantages

### ***Reduced Cost of Ownership***

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based Automotive ProASIC3 devices allow all functionality to be live at power-up; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Flash-based FPGAs are LAPU Class 0 devices, offering the lowest available power in a single-chip device and providing firm-error immunity. The Automotive ProASIC3 family device architecture mitigates the need for ASIC migration at high user volumes. This makes the Automotive ProASIC3 family a cost-effective ASIC replacement solution, especially for automotive applications.

### ***Security***

Nonvolatile, flash-based Automotive ProASIC3 devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. Automotive ProASIC3 devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

Automotive ProASIC3 devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for intellectual property and configuration data. In addition, all FlashROM data in Automotive ProASIC3 devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. The AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. Automotive ProASIC3 devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. Automotive ProASIC3 devices with AES-based security provide a high level of protection for secure, remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves. Additionally, security features of Automotive ProASIC3 devices provide anti-tampering protection.

Security, built into the FPGA fabric, is an inherent component of the Automotive ProASIC3 family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The Automotive ProASIC3 family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. An Automotive ProASIC3 device provides the best available security for programmable logic designs.

### **Single Chip**

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based Automotive ProASIC3 FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

### **Live at Power-Up**

The Microsemi flash-based Automotive ProASIC3 devices support Level 0 of the LAPU classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The LAPU feature of flash-based Automotive ProASIC3 devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and external clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the Automotive ProASIC3 device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based Automotive ProASIC3 devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

### **Firm-Error Immunity**

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of Automotive ProASIC3 flash-based FPGAs. Once it is programmed, the flash cell configuration element of Automotive ProASIC3 FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

### **Low Power**

Flash-based Automotive ProASIC3 devices exhibit very low power characteristics, similar to those of an ASIC, making them an ideal choice for power-sensitive applications. Automotive ProASIC3 devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

Automotive ProASIC3 devices also have low dynamic power consumption to further maximize power savings.

## **Advanced Flash Technology**

The Automotive ProASIC3 family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVCMOS process with seven layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

## Advanced Architecture

The proprietary Automotive ProASIC3 architecture provides granularity comparable to standard-cell ASICs. The Automotive ProASIC3 device consists of five distinct and programmable architectural features (Figure 1-1 and Figure 1-2 on page 1-4):

- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM memory
- Extensive CCCs and PLLs
- Advanced I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the Automotive ProASIC3 core tile as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the Microsemi ProASIC family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

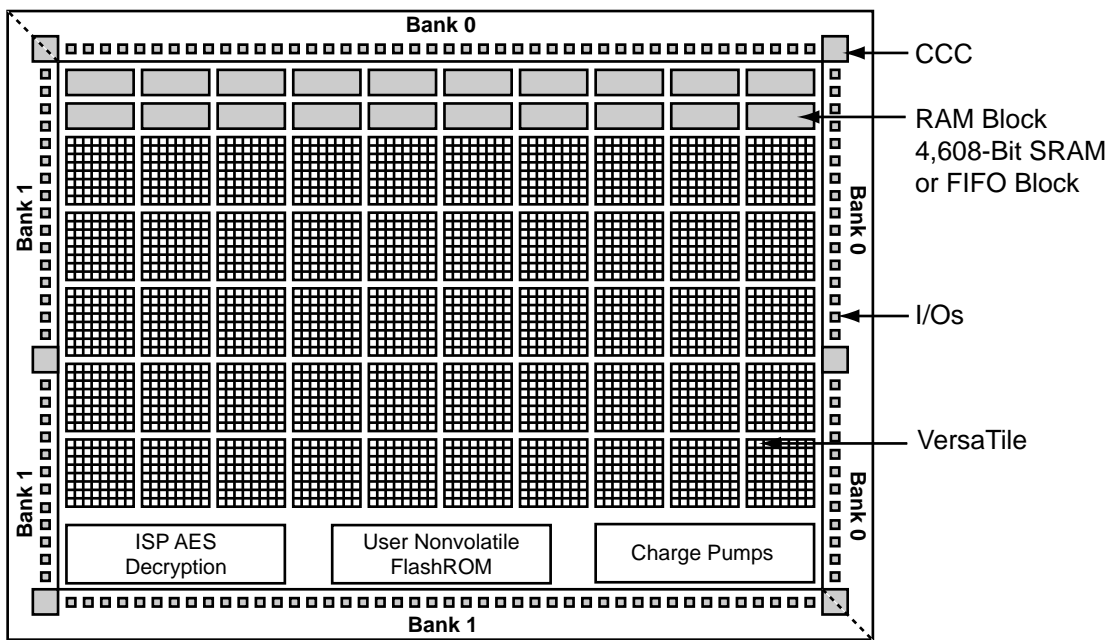

Figure 1-1 • Automotive ProASIC3 Device Architecture Overview with Two I/O Banks (A3P060 and A3P125)

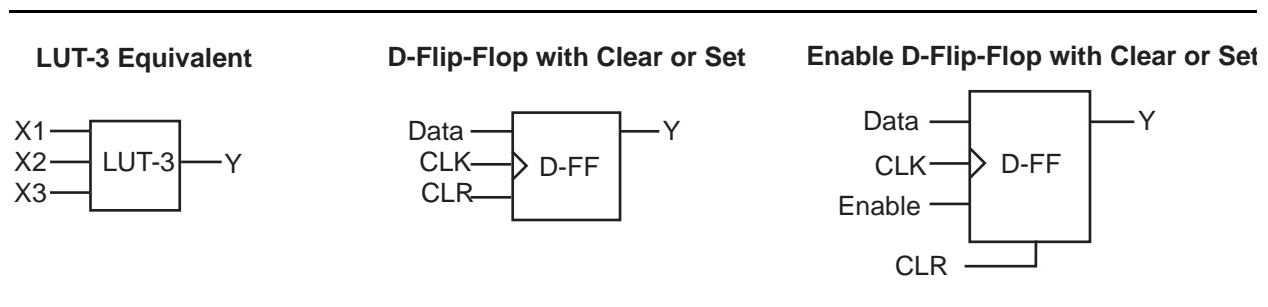

**Figure 1-2 • Automotive ProASIC3 Device Architecture Overview with Four I/O Banks (A3P600 and A3P1000)**

### VersaTiles

The Automotive ProASIC3 core consists of VersaTiles, which have been enhanced beyond the ProASIC<sup>PLUS</sup>® core tiles. The Automotive ProASIC3 VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to [Figure 1-3](#) for VersaTile configurations.

**Figure 1-3 • VersaTile Configurations**

## **User Nonvolatile FlashROM**

Automotive ProASIC3 devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Unique protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, infotainment systems)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard Automotive ProASIC3 IEEE 1532 JTAG programming interface.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

Automotive ProASIC3 development software solutions, Libero® Integrated Design Environment (IDE) and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Libero IDE and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

## **SRAM**

Automotive ProASIC3 devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256x18, 512x9, 1kx4, 2kx2, and 4kx1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

## **PLL and CCC**

Automotive ProASIC3 devices provide designers with very flexible clock conditioning circuit (CCC) capabilities. Each member of the Automotive ProASIC3 family contains six CCCs. One CCC (center west side) has a PLL.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range ( $f_{IN\_CCC}$ ) = 1.5 MHz to 350 MHz
- Output frequency range ( $f_{OUT\_CCC}$ ) = 0.75 MHz to 350 MHz
- Clock delay adjustment via programmable and fixed delays from -7.56 ns to +11.12 ns
- 2 programmable delay types for clock skew minimization

- Clock frequency synthesis (for PLL only)

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration (for PLL only).
- Output duty cycle = 50% ± 1.5% or better (for PLL only)
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used (for PLL only)
- Maximum acquisition time is 300 μs (for PLL only)
- Low power consumption of 5 mW
- Exceptional tolerance to input period jitter— allowable input jitter is up to 1.5 ns (for PLL only)
- Four precise phases; maximum misalignment between adjacent phases of 40 ps × 350 MHz /  $f_{OUT\_CCC}$  (for PLL only)

### **Global Clocking**

Automotive ProASIC3 devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

### **I/Os with Advanced I/O Standards**

The Automotive ProASIC3 family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.5 V, 1.8 V, 2.5 V, and 3.3 V). Automotive ProASIC3 FPGAs support many different I/O standards—single-ended and differential.

The I/Os are organized into banks, with two or four banks per device. The configuration of these banks determines the I/O standards supported.

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-Data-Rate applications
- Double-Data-Rate applications—DDR LVDS, B-LVDS, and M-LVDS I/Os for point-to-point communications

Automotive ProASIC3 banks for the A3P250 and A3P1000 devices support LVPECL, LVDS, B-LVDS, and M-LVDS. B-LVDS and M-LVDS can support up to 20 loads.

## **Specifying I/O States During Programming**

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the [FlashPro User's Guide](#) for more information.

**Note:** PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the Specify I/O States During Programming button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify ([Figure 1-4 on page 1-7](#)).

5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:
  - 1 – I/O is set to drive out logic High
  - 0 – I/O is set to drive out logic Low
  - Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming
  - Z -Tristate: I/O is tristated

Figure 1-4 • I/O States During Programming Window

6. Click OK to return to the FlashPoint – Programming File Generator window.

**Note:** I/O States During programming are saved to the ADB and resulting programming files after completing programming file generation.

## 2 – Automotive ProASIC3 DC and Switching Characteristics

### General Specifications

#### Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximums are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2](#) on [page 2-2](#) is not implied.

**Table 2-1 • Absolute Maximum Ratings**

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPUMP	Programming voltage	–0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	–0.3 to 1.65	V
VCCI	DC I/O output buffer supply voltage	–0.3 to 3.75	V
VMV	DC I/O input buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3 V to 3.6 V (when I/O hot insertion mode is enabled) –0.3 V to (V <sub>CCI</sub> + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T <sub>STG</sub> <sup>2</sup>	Storage temperature	–65 to +150	°C
T <sub>J</sub> <sup>2</sup>	Junction temperature	+150	°C

**Notes:**

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 2-3](#) on [page 2-3](#).
2. For flash programming and retention maximum limits, refer to [Figure 2-1](#) on [page 2-2](#). For recommended operating limits, refer to [Table 2-2](#) on [page 2-2](#).

**Table 2-2 • Recommended Operating Conditions**

Symbol	Parameter	Automotive Grade 1	Automotive Grade 2	Units	
T <sub>J</sub>	Junction temperature	-40 to +135	-40 to +115	°C	
VCC	1.5 V DC core supply voltage	1.425 to 1.575	1.425 to 1.575	V	
VJTAG	JTAG DC voltage	1.4 to 3.6	1.4 to 3.6	V	
VPUMP	Programming voltage	Programming Mode	3.0 to 3.6	3.0 to 3.6	V
		Operation <sup>3</sup>	0 to 3.6	0 to 3.6	V
VCCPLL	Analog power supply (PLL)	1.425 to 1.575	1.425 to 1.575	V	
VCCI and VMV	1.5 V DC supply voltage	1.425 to 1.575	1.425 to 1.575	V	
	1.8 V DC supply voltage	1.7 to 1.9	1.7 to 1.9	V	
	2.5 V DC supply voltage	2.3 to 2.7	2.3 to 2.7	V	
	3.3 V DC supply voltage	3.0 to 3.6	3.0 to 3.6	V	
	LVDS/B-LVDS/M-LVDS differential I/O	2.375 to 2.625	2.375 to 2.625	V	
	LVPECL differential I/O	3.0 to 3.6	3.0 to 3.6	V	

**Notes:**

- The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in [Table 2-14 on page 2-16](#). VMV and VCCI should be at the same voltage within a given I/O bank.
- All parameters representing voltages are measured with respect to GND unless otherwise specified.
- V<sub>PUMP</sub> can be left floating during operation (not programming mode).

T <sub>J</sub> (°C)	HTR Lifetime (yrs)
70	102.7
85	43.8
100	20.0
105	15.6
110	12.3
115	9.7
120	7.7
125	6.2
130	5.0
135	4.0
140	3.3
145	2.7
150	2.2

**Note:** HTR time is the period during which you would not expect a verify failure due to flash cell leakage.

**Figure 2-1 • High-Temperature Data Retention (HTR)**

**Table 2-3 • Overshoot and Undershoot Limits (as measured on quiet I/Os)**

VCCI and VMV	Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle	Maximum Overshoot/Undershoot (115°C)	Maximum Overshoot/Undershoot (135°C)
2.7 V or less	10%	0.81 V	0.72 V
	5%	0.90 V	0.82 V
3 V	10%	0.80 V	0.72 V
	5%	0.90 V	0.81 V
3.3 V	10%	0.79 V	0.69 V
	5%	0.88 V	0.79 V
3.6 V	10%	N/A	N/A
	5%	N/A	N/A

**Notes:**

1. The duration is allowed at one out of six clock cycles (estimated SSO density over cycles). If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.
2. This table refers only to overshoot/undershoot limits for simultaneously switching I/Os and does not provide PCI overshoot/undershoot limits.

## I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every ProASIC<sup>®</sup>3 device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in [Figure 2-2 on page 2-4](#).

There are five regions to consider during power-up.

ProASIC3 I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points ([Figure 2-2 on page 2-4](#)).
2.  $VCCI > VCC - 0.75 \text{ V}$  (typical)
3. Chip is in the operating mode.

**VCCI Trip Point:**

Ramping up:  $0.6 \text{ V} < \text{trip\_point\_up} < 1.2 \text{ V}$

Ramping down:  $0.5 \text{ V} < \text{trip\_point\_down} < 1.1 \text{ V}$

**VCC Trip Point:**

Ramping up:  $0.6 \text{ V} < \text{trip\_point\_up} < 1.1 \text{ V}$

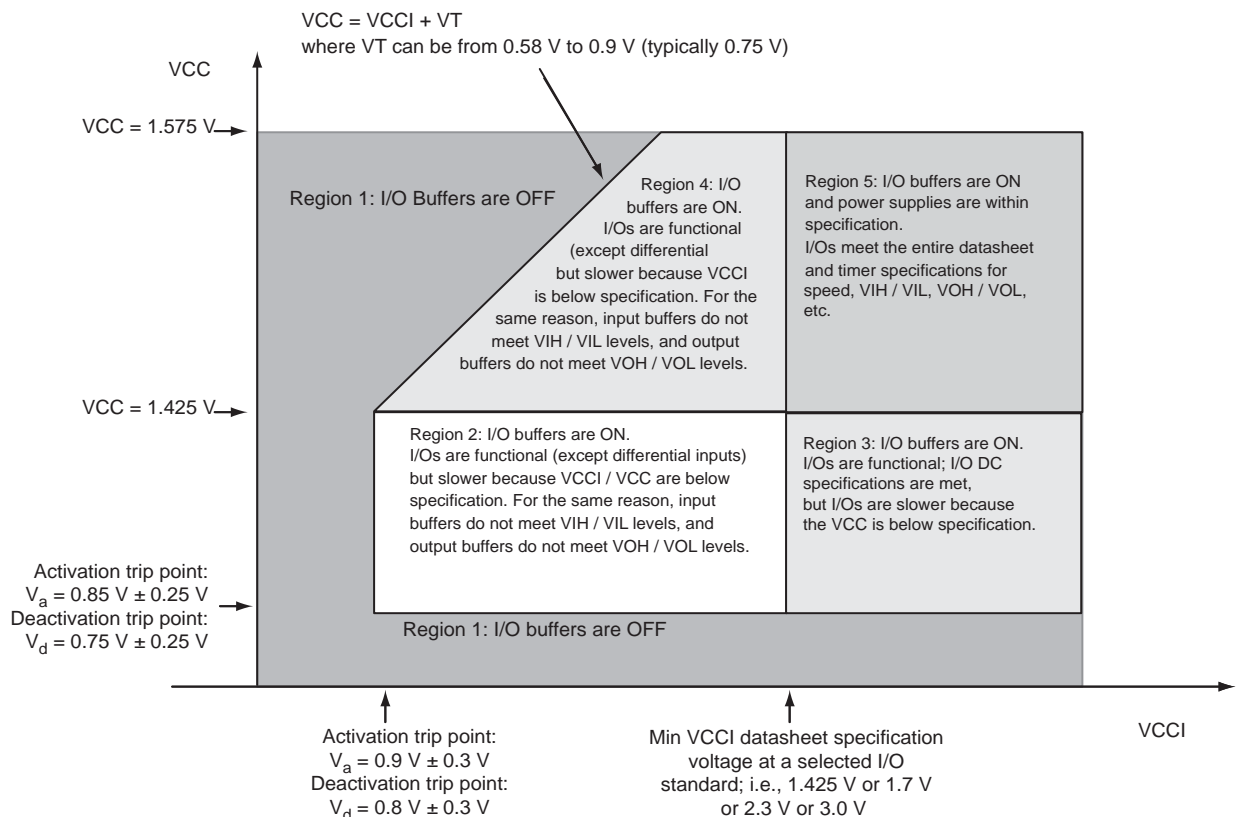

Ramping down:  $0.5 \text{ V} < \text{trip\_point\_down} < 1 \text{ V}$

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to  $V_{CCI}$ .
- JTAG supply, PLL power supplies, and charge pump  $V_{PUMP}$  supply have no influence on I/O behavior.

### Internal Power-Up Activation Sequence

1. Core
2. Input buffers
3. Output buffers, after 200 ns delay from input buffer activation

**Figure 2-2 • I/O State as a Function of VCCI and VCC Voltage Levels**

## Thermal Characteristics

### Introduction

The temperature variable in Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

EQ 1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 1

where:

$T_A$  = Ambient Temperature

$\Delta T$  = Temperature gradient between junction (silicon) and ambient  $\Delta T = \theta_{ja} * P$

$\theta_{ja}$  = Junction-to-ambient of the package.  $\theta_{ja}$  numbers are located in Table 2-4 on page 2-5.

P = Power dissipation

## Package Thermal Characteristics

The device junction-to-case thermal resistivity is  $\theta_{jc}$  and the junction-to-ambient air thermal resistivity is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown for two air flow rates. The absolute maximum junction temperature is 110°C. EQ 2 shows a sample calculation of the absolute maximum power dissipation allowed for a 484-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (}^\circ\text{C)} - \text{Max. ambient temp. (}^\circ\text{C)}}{\theta_{ja} (^\circ\text{C/W)}} = \frac{110^\circ\text{C} - 70^\circ\text{C}}{20.5^\circ\text{C/W}} = 1.951 \text{ W}$$

EQ 2

**Table 2-4 • Package Thermal Resistivities**

Package Type	Device	Pin Count	$\theta_{jc}$	$\theta_{ja}$			Units
				Still Air	200 ft./min.	500 ft./min.	
Very Thin Quad Flat Pack (VQFP)	All devices	100	10.0	35.3	29.4	27.1	°C/W
Fine Pitch Ball Grid Array (FBGA)	See note*	144	3.8	26.9	22.9	21.5	°C/W
	See note*	256	3.8	26.6	22.8	21.5	°C/W
	See note*	484	3.2	20.5	17.0	15.9	°C/W
	A3P1000	144	6.3	31.6	26.2	24.2	°C/W
	A3P1000	256	6.6	28.1	24.4	22.7	°C/W
	A3P1000	484	8.0	23.3	19.0	16.7	°C/W

*Note:* \*This information applies to all ProASIC3 devices except the A3P1000. Detailed device/package thermal information will be available in future revisions of the datasheet.

## Temperature and Voltage Derating Factors

**Table 2-5 • Temperature and Voltage Derating Factors for Timing Delays  
(normalized to  $T_j = 115^\circ\text{C}$ ,  $V_{CC} = 1.425 \text{ V}$ )**

Array Voltage VCC (V)	-40°C	0°C	25°C	70°C	85°C	115°C	125°C	135°C
1.425	0.83	0.88	0.90	0.95	0.97	1.00	1.01	1.02
1.5	0.79	0.83	0.85	0.90	0.92	0.95	0.96	0.97
1.575	0.76	0.80	0.82	0.87	0.88	0.91	0.93	0.94

## Calculating Power Dissipation

### Quiescent Supply Current

**Table 2-6 • Quiescent Supply Current Characteristics**

	A3P060	A3P125	A3P250	A3P1000
Typical (25°C)	2 mA	2 mA	3 mA	8 mA
Maximum (Automotive Grade 1) – 135°C	53 mA	53 mA	106 mA	265 mA
Maximum (Automotive Grade 2) – 115°C	26 mA	26 mA	53 mA	131 mA

*Note:*  $I_{DD}$  includes VCC, VPUMP, VCCI, and VMV currents. Values do not include I/O static contribution, which is shown in Table 2-7 and Table 2-10 on page 2-8.

### Power per I/O Pin

**Table 2-7 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings<sup>1</sup>  
Applicable to Advanced I/O Banks**

	VMV (V)	Static Power PDC2 (mW) <sup>1</sup>	Dynamic Power PAC9 (μW/MHz) <sup>2</sup>
<b>Single-Ended</b>			
3.3 V LVTTTL / 3.3 V LVCMOS	3.3	–	16.69
2.5 V LVCMOS	2.5	–	5.12
1.8 V LVCMOS	1.8	–	2.13
1.5 V LVCMOS (JESD8-11)	1.5	–	1.45
3.3 V PCI	3.3	–	18.11
3.3 V PCI-X	3.3	–	18.11
<b>Differential</b>			
LVDS	2.5	2.26	1.20
LVPECL	3.3	5.72	1.87

*Notes:*

- $P_{DC2}$  is the static power (where applicable) measured on VMV.
- $P_{AC9}$  is the total dynamic power measured on VCC and VMV.

**Table 2-8 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings<sup>1</sup>  
Applicable to Standard Plus I/O Banks**

	VMV (V)	Static Power PDC2 (mW) <sup>1</sup>	Dynamic Power PAC9 (μW/MHz) <sup>2</sup>
<b>Single-Ended</b>			
3.3 V LVTTTL / 3.3 V LVCMOS	3.3	–	16.72
2.5 V LVCMOS	2.5	–	5.14
1.8 V LVCMOS	1.8	–	2.13
1.5 V LVCMOS (JESD8-11)	1.5	–	1.48
3.3 V PCI	3.3	–	18.13
3.3 V PCI-X	3.3	–	18.13

**Notes:**

1.  $P_{DC2}$  is the static power (where applicable) measured on VMV.
2.  $P_{AC9}$  is the total dynamic power measured on  $V_{CC}$  and VMV.

**Table 2-9 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings<sup>1</sup>  
Applicable to Advanced I/O Banks**

	$C_{LOAD}$ (pF)	VCCI (V)	Static Power PDC3 (mW) <sup>2</sup>	Dynamic Power PAC10 (μW/MHz) <sup>3</sup>
<b>Single-Ended</b>				
3.3 V LVTTTL / 3.3 V LVCMOS	35	3.3	–	468.67
2.5 V LVCMOS	35	2.5	–	267.48
1.8 V LVCMOS	35	1.8	–	149.46
1.5 V LVCMOS (JESD8-11)	35	1.5	–	103.12
3.3 V PCI	10	3.3	–	201.02
3.3 V PCI-X	10	3.3	–	201.02
<b>Differential</b>				
LVDS	–	2.5	7.74	88.92
LVPECL	–	3.3	19.54	166.52

**Notes:**

1. Dynamic power consumption is given for standard load and software default drive strength and output slew.
2.  $P_{DC3}$  is the static power (where applicable) measured on VMV.
3.  $P_{AC10}$  is the total dynamic power measured on  $V_{CCI}$  and VMV.

**Table 2-10 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings <sup>1</sup>**  
**Applicable to Standard Plus I/O Banks**

	$C_{LOAD}$ (pF)	VCCI (V)	Static Power PDC3 (mW) <sup>2</sup>	Dynamic Power PAC10 ( $\mu$ W/MHz) <sup>3</sup>
<b>Single-Ended</b>				
3.3 V LVTTTL / 3.3 V LVCMOS	35	3.3	–	452.67
2.5 V LVCMOS	35	2.5	–	258.32
1.8 V LVCMOS	35	1.8	–	133.59
1.5 V LVCMOS (JESD8-11)	35	1.5	–	92.84
3.3 V PCI	10	3.3	–	184.92
3.3 V PCI-X	10	3.3	–	184.92

*Notes:*

1. Dynamic power consumption is given for standard load and software default drive strength and output slew.
2. PDC3 is the static power (where applicable) measured on VMV.
3. PAC10 is the total dynamic power measured on VCCI and VMV.

## Power Consumption of Various Internal Resources

**Table 2-11 • Different Components Contributing to Dynamic Power Consumption in ProASIC3 Devices**

Parameter	Definition	Device Specific Dynamic Power (μW/MHz)			
		A3P1000	A3P250	A3P125	A3P060
PAC1	Clock contribution of a Global Rib	14.50	11.00	11.00	9.30
PAC2	Clock contribution of a Global Spine	2.48	1.58	0.81	0.81
PAC3	Clock contribution of a VersaTile row	0.81			
PAC4	Clock contribution of a VersaTile used as a sequential module	0.12			
PAC5	First contribution of a VersaTile used as a sequential module	0.07			
PAC6	Second contribution of a VersaTile used as a sequential module	0.29			
PAC7	Contribution of a VersaTile used as a combinatorial module	0.29			
PAC8	Average contribution of a routing net	0.70			
PAC9	Contribution of an I/O input pin (standard-dependent)	See Table 2-7 on page 2-6.			
PAC10	Contribution of an I/O output pin (standard-dependent)	See Table 2-7 and Table 2-10 on page 2-8.			
PAC11	Average contribution of a RAM block during a read operation	25.00			
PAC12	Average contribution of a RAM block during a write operation	30.00			
PAC13	Static PLL contribution	2.55 mW			
PAC14	Dynamic contribution for PLL	2.60			

*Note:* \*For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in Libero® Integrated Design Environment (IDE).

## Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in Libero IDE software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in Table 2-12 on page 2-11.
- Enable rates of output buffers—guidelines are provided for typical applications in Table 2-13 on page 2-12.
- Read rate and write rate to the memory—guidelines are provided for typical applications in Table 2-13 on page 2-12. The calculation should be repeated for each clock domain defined in the design.

### Methodology

#### Total Power Consumption— $P_{TOTAL}$

$$P_{TOTAL} = P_{STAT} + P_{DYN}$$

$P_{STAT}$  is the total static power consumption.

$P_{DYN}$  is the total dynamic power consumption.

**Total Static Power Consumption— $P_{STAT}$** 

$$P_{STAT} = PDC1 + N_{INPUTS} * PDC2 + N_{OUTPUTS} * PDC3$$

$N_{INPUTS}$  is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$  is the number of I/O output buffers used in the design.

**Total Dynamic Power Consumption— $P_{DYN}$** 

$$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$$

**Global Clock Contribution— $P_{CLOCK}$** 

$$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S-CELL} * PAC4) * F_{CLK}$$

$N_{SPINE}$  is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Automotive ProASIC3 FPGA Fabric User's Guide*.

$N_{ROW}$  is the number of VersaTile rows used in the design—guidelines are provided in the *Automotive ProASIC3 FPGA Fabric User's Guide*.

$F_{CLK}$  is the global clock signal frequency.

$N_{S-CELL}$  is the number of VersaTiles used as sequential modules in the design.

PAC1, PAC2, PAC3, and PAC4 are device-dependent.

**Sequential Cells Contribution— $P_{S-CELL}$** 

$$P_{S-CELL} = N_{S-CELL} * (PAC5 + \alpha_1 / 2 * PAC6) * F_{CLK}$$

$N_{S-CELL}$  is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

$\alpha_1$  is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-12 on page 2-11](#).

$F_{CLK}$  is the global clock signal frequency.

**Combinatorial Cells Contribution— $P_{C-CELL}$** 

$$P_{C-CELL} = N_{C-CELL} * \alpha_1 / 2 * PAC7 * F_{CLK}$$

$N_{C-CELL}$  is the number of VersaTiles used as combinatorial modules in the design.

$\alpha_1$  is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-12 on page 2-11](#).

$F_{CLK}$  is the global clock signal frequency.

**Routing Net Contribution— $P_{NET}$** 

$$P_{NET} = (N_{S-CELL} + N_{C-CELL}) * \alpha_1 / 2 * PAC8 * F_{CLK}$$

$N_{S-CELL}$  is the number VersaTiles used as sequential modules in the design.

$N_{C-CELL}$  is the number of VersaTiles used as combinatorial modules in the design.

$\alpha_1$  is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-12 on page 2-11](#).

$F_{CLK}$  is the global clock signal frequency.

**I/O Input Buffer Contribution— $P_{INPUTS}$** 

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * PAC9 * F_{CLK}$$

$N_{INPUTS}$  is the number of I/O input buffers used in the design.

$\alpha_2$  is the I/O buffer toggle rate—guidelines are provided in [Table 2-12 on page 2-11](#).

$F_{CLK}$  is the global clock signal frequency.

### I/O Output Buffer Contribution— $P_{\text{OUTPUTS}}$

$$P_{\text{OUTPUTS}} = N_{\text{OUTPUTS}} * \alpha_2 / 2 * \beta_1 * PAC10 * F_{\text{CLK}}$$

$N_{\text{OUTPUTS}}$  is the number of I/O output buffers used in the design.

$\alpha_2$  is the I/O buffer toggle rate—guidelines are provided in Table 2-12.

$\beta_1$  is the I/O buffer enable rate—guidelines are provided in Table 2-13 on page 2-12.

$F_{\text{CLK}}$  is the global clock signal frequency.

### RAM Contribution— $P_{\text{MEMORY}}$

$$P_{\text{MEMORY}} = PAC11 * N_{\text{BLOCKS}} * F_{\text{READ-CLOCK}} * \beta_2 + PAC12 * N_{\text{BLOCK}} * F_{\text{WRITE-CLOCK}} * \beta_3$$

$N_{\text{BLOCKS}}$  is the number of RAM blocks used in the design.

$F_{\text{READ-CLOCK}}$  is the memory read clock frequency.

$\beta_2$  is the RAM enable rate for read operations.

$F_{\text{WRITE-CLOCK}}$  is the memory write clock frequency.

$\beta_3$  is the RAM enable rate for write operations—guidelines are provided in Table 2-13 on page 2-12.

### PLL Contribution— $P_{\text{PLL}}$

$$P_{\text{PLL}} = PAC13 + PAC14 * F_{\text{CLKOUT}}$$

$F_{\text{CLKIN}}$  is the input clock frequency.

$F_{\text{CLKOUT}}$  is the output clock frequency.<sup>1</sup>

## Guidelines

### Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - ...
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . + 0.78125%) / 8

### Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

**Table 2-12 • Toggle Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
$\alpha_1$	Toggle rate of VersaTile outputs	10%
$\alpha_2$	I/O buffer toggle rate	10%

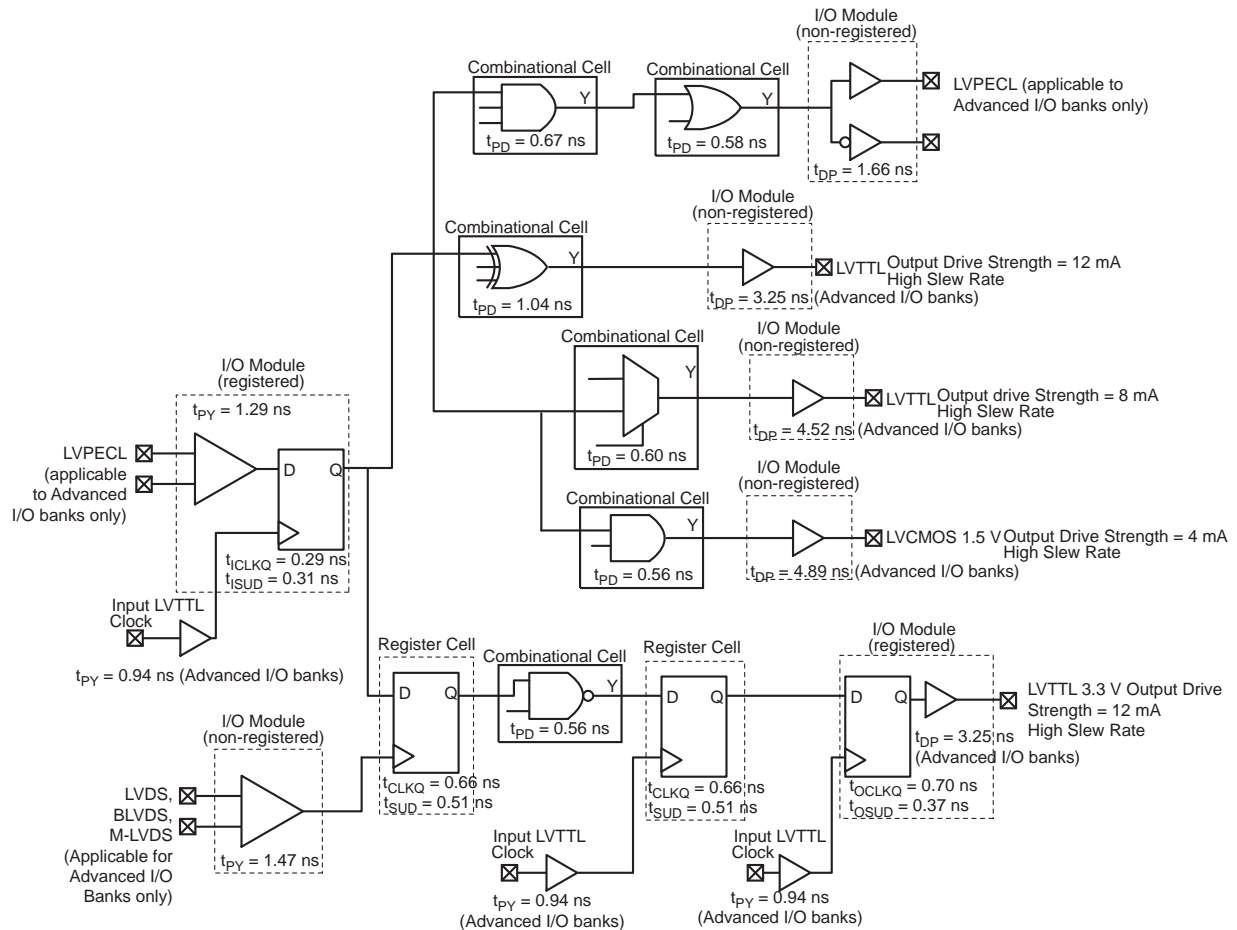

1. The PLL dynamic contribution depends on the input clock frequency, the number of output clock signals generated by the PLL, and the frequency of each output clock. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ( $PAC14 * F_{\text{CLKOUT}}$  product) to the total PLL contribution.

**Table 2-13 • Enable Rate Guidelines Recommended for Power Calculation**

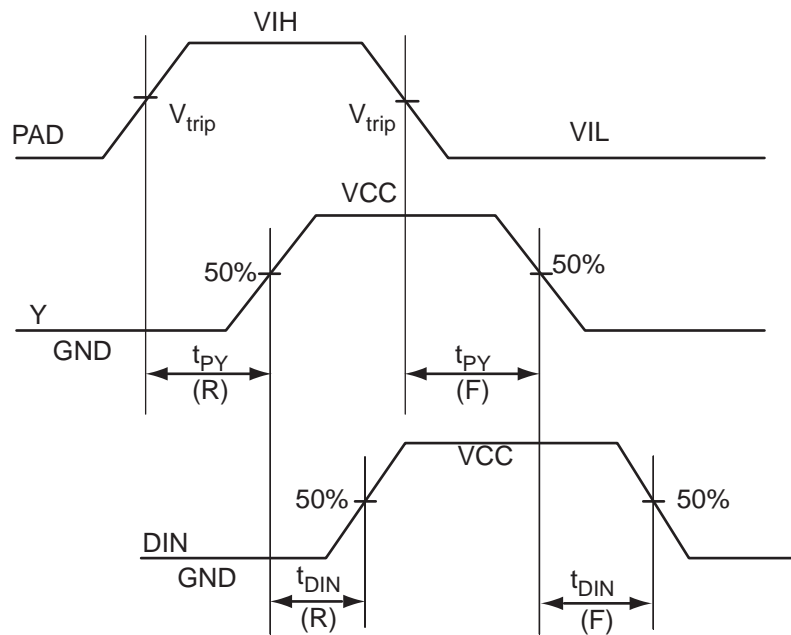

Component	Definition	Guideline
$\beta_1$	I/O output buffer enable rate	100%
$\beta_2$	RAM enable rate for read operations	12.5%
$\beta_3$	RAM enable rate for write operations	12.5%

## User I/O Characteristics

### Timing Model

**Figure 2-3 • Timing Model**

Operating Conditions:  $-1$  Speed, Automotive Grade 2 Temp. Range ( $T_j = 115^\circ\text{C}$ ), Worst Case  $V_{CC} = 1.425$  V

**Figure 2-4 • Input Buffer Timing Model and Delays (example)**

**Figure 2-5 • Output Buffer Model and Delays (example)**

## Overview of I/O Performance

### Summary of I/O DC Input and Output Levels – Default I/O Software Settings

**Table 2-14 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings**  
Applicable to Advanced I/O Banks

I/O Standard	Drive Strength	Slew Rate	VIL		VIH		VOL	VOH	I <sub>OL</sub>	I <sub>OH</sub>
			Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
3.3 V LVTTTL / 3.3 V LVCMOS	12 mA	High	-0.3	0.8	2	3.6	0.4	2.4	12	12
2.5 V LVCMOS	12 mA	High	-0.3	0.7	1.7	3.6	0.7	1.7	12	12
1.8 V LVCMOS	12 mA	High	-0.3	0.35 * V <sub>CCI</sub>	0.65 * V <sub>CCI</sub>	3.6	0.45	V <sub>CCI</sub> - 0.45	12	12
1.5 V LVCMOS	12 mA	High	-0.3	0.30 * V <sub>CCI</sub>	0.7 * V <sub>CCI</sub>	3.6	0.25 * V <sub>CCI</sub>	0.75 * V <sub>CCI</sub>	12	12
3.3 V PCI	Per PCI specifications									
3.3 V PCI-X	Per PCI-X specifications									

Note: Currents are measured at 125°C junction temperature.

**Table 2-15 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings**  
Applicable to Standard Plus I/O Banks

I/O Standard	Drive Strength	Slew Rate	VIL		VIH		VOL	VOH	I <sub>OL</sub>	I <sub>OH</sub>
			Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
3.3 V LVTTTL / 3.3 V LVCMOS	12 mA	High	-0.3	0.8	2	3.6	0.4	2.4	12	12
2.5 V LVCMOS	12 mA	High	-0.3	0.7	1.7	3.6	0.7	1.7	12	12
1.8 V LVCMOS	8 mA	High	-0.3	0.35 * V <sub>CCI</sub>	0.65 * V <sub>CCI</sub>	3.6	0.45	V <sub>CCI</sub> - 0.45	8	8
1.5 V LVCMOS	4 mA	High	-0.3	0.30 * V <sub>CCI</sub>	0.7 * V <sub>CCI</sub>	3.6	0.25 * V <sub>CCI</sub>	0.75 * V <sub>CCI</sub>	4	4
3.3 V PCI	Per PCI specifications									
3.3 V PCI-X	Per PCI-X specifications									

Note: Currents are measured at 125°C junction temperature.

**Table 2-16 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings Applicable to Standard I/O Banks**

I/O Standard	Drive Strength	Slew Rate	VIL		VIH		VOL	VOH	I <sub>OL</sub>	I <sub>OH</sub>
			Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA
3.3 V LVTTTL / 3.3 V LVCMOS	8 mA	High	-0.3	0.8	2	3.6	0.4	2.4	8	8
2.5 V LVCMOS	8 mA	High	-0.3	0.7	1.7	3.6	0.7	1.7	8	8
1.8 V LVCMOS	4 mA	High	-0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI - 0.45	4	4
1.5 V LVCMOS	2 mA	High	-0.3	0.30 * VCCI	0.7 * VCCI	3.6	0.25 * VCCI	0.75 * VCCI	2	2

Note: Currents are measured at 125°C junction temperature.

**Table 2-17 • Summary of Maximum and Minimum DC Input Levels Applicable to Automotive Grade 1 and Grade 2**

DC I/O Standards	Automotive Grade 1 <sup>1</sup>		Automotive Grade 2 <sup>2</sup>	
	IIL	IIH	IIL	IIH
	µA	µA	µA	µA
3.3 V LVTTTL / 3.3 V LVCMOS	10	10	15	15
2.5 V LVCMOS	10	10	15	15
1.8 V LVCMOS	10	10	15	15
1.5 V LVCMOS	10	10	15	15
3.3 V PCI	10	10	15	15
3.3 V PCI-X	10	10	15	15

Notes:

1. Automotive range Grade 1 ( $-40^{\circ}\text{C} < T_J < 135^{\circ}\text{C}$ )
2. Automotive range Grade 2 ( $-40^{\circ}\text{C} < T_J < 115^{\circ}\text{C}$ )

### Summary of I/O Timing Characteristics – Default I/O Software Settings

**Table 2-18 • Summary of AC Measuring Points**

Standard	Measuring Trip Point (Vtrip)
3.3 V LVTTTL / 3.3 V LVCMOS	1.4 V
2.5 V LVCMOS	1.2 V
1.8 V LVCMOS	0.90 V
1.5 V LVCMOS	0.75 V
3.3 V PCI	0.285 * VCCI (RR)
	0.615 * VCCI (FF)
3.3 V PCI-X	0.285 * VCCI (RR)
	0.615 * VCCI (FF)

**Table 2-19 • I/O AC Parameter Definitions**

Parameter	Parameter Definition
$t_{DP}$	Data-to-Pad delay through the Output Buffer
$t_{PY}$	Pad-to-Data delay through the Input Buffer
$t_{DOUT}$	Data-to-Output Buffer delay through the I/O interface
$t_{EOUT}$	Enable-to-Output Buffer Tristate Control delay through the I/O interface
$t_{DIN}$	Input Buffer-to-Data delay through the I/O interface
$t_{HZ}$	Enable-to-Pad delay through the Output Buffer—High to Z
$t_{ZH}$	Enable-to-Pad delay through the Output Buffer—Z to High
$t_{LZ}$	Enable-to-Pad delay through the Output Buffer—Low to Z
$t_{ZL}$	Enable-to-Pad delay through the Output Buffer—Z to Low
$t_{ZHS}$	Enable-to-Pad delay through the Output Buffer with delayed enable—Z to High
$t_{ZLS}$	Enable-to-Pad delay through the Output Buffer with delayed enable—Z to Low

**Table 2-20 • Summary of I/O Timing Characteristics—Software Default Settings**

–1 Speed Grade, Automotive-Case Conditions:  $T_J = 115^\circ\text{C}$ , Worst Case  $V_{CC} = 1.425\text{ V}$   
 Worst Case  $V_{CCI} = 3.0\text{ V}$

	12 mA	74	65
1.8 V LVCMOS	2 mA	11	9
	4 mA	22	17
	6 mA	44	35
	8 mA	44	35
1.5 V LVCMOS	2 mA	16	13
	4 mA	33	25
3.3 V PCI/PCI-X	Per PCI/PCI-X specification	109	103

Note: \*T<sub>J</sub> = 100°C

The length of time an I/O can withstand I<sub>OSH</sub>/I<sub>OSL</sub> events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 110°C, the short current condition would have to be sustained for more than three months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

**Table 2-30 • Duration of Short Circuit Event before Failure**

Temperature	Time before Failure
-40°C	> 20 years
0°C	> 20 years
25°C	> 20 years
70°C	5 years
85°C	2 years
100°C	6 months
110°C	3 months
125°C	25 days
135°	12 days

**Table 2-31 • I/O Input Rise Time, Fall Time, and Related I/O Reliability**

<b>Input Buffer</b>	<b>Input Rise/Fall Time (min.)</b>	<b>Input Rise/Fall Time (max.)</b>	<b>Reliability</b>
LVTTTL/LVCMOS	No requirement	10 ns *	20 years (110°C)
LVDS/B-LVDS/M-LVDS/LVPECL	No requirement	10 ns *	10 years (100°C)

*Note:* \*The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure there is no excessive noise coupling into input signals.

## Single-Ended I/O Characteristics

### 3.3 V LVTTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTTL input buffer and push-pull output buffer.

**Table 2-32 • Minimum and Maximum DC Input and Output Levels**  
Applicable to Advanced I/O Banks

## 2.5 V LVCMOS

Low-Voltage CMOS for 2.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 2.5 V applications.

**Table 2-43 • Minimum and Maximum DC Input and Output Levels**  
Applicable to Advanced I/O Banks

2.5 V LVCMOS	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL	IIH
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA <sup>1</sup>	Max. mA <sup>1</sup>	μA <sup>2</sup>	μA <sup>2</sup>

### 1.8 V LVCMOS

Low-voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and a push-pull output buffer.

**Table 2-54 • Minimum and Maximum DC Input and Output Levels**  
Applicable to Advanced I/O Banks

1.8 V LVCMOS	VIL		VIH		VOL	VOH	I <sub>OL</sub>	I <sub>OH</sub>	I <sub>OSL</sub>	I <sub>OSH</sub>	I <sub>IL</sub>	I <sub>IH</sub>

### 1.5 V LVCMOS (JESD8-11)

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

**Table 2-65 • Minimum and Maximum DC Input and Output Levels**  
 Applicable to Advanced I/O Banks

1.5 V LVCMOS	VIL		VIH		VOL	VOH	$I_{OL}$	$I_{OH}$	$I_{OSL}$	$I_{OSH}$	$I_{IL}$	$I_{IH}$
	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA <sup>1</sup>	Max. mA <sup>1</sup>	$\mu\text{A}^2$	$\mu\text{A}^2$

## Differential I/O Characteristics

### Physical Implementation

Configuration of the I/O modules as a differential pair is handled by Actel Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

### LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-12 on page 2-50](#). The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, ProASIC3 also supports Bus LVDS structure and Multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

**Figure 2-12 • LVDS Circuit Diagram and Board-Level Implementation**
**Table 2-82 • Minimum and Maximum DC Input and Output Levels**

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VOH	Output High Voltage	1.25	1.425	1.6	V
VI	Input Voltage	0	–	2.925	V

Note: For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-5 for derating values.

## B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Actel LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF\_LVDS and BIBUF\_LVDS macros along with appropriate terminations. Multipoint designs using Actel LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in [Figure 2-13](#). The input and output buffer delays are available in the LVDS section in [Table 2-84](#) on [page 2-50](#).

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver:  $R_S = 60 \Omega$  and  $R_T = 70 \Omega$ , given  $Z_0 = 50 \Omega$  (2") and  $Z_{\text{stub}} = 50 \Omega$  (~1.5").

**Figure 2-13 • B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers**

## LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-14](#) on [page 2-52](#). The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

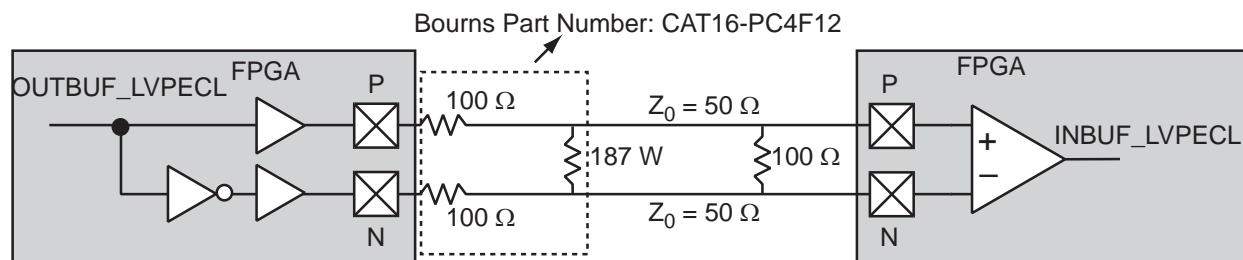

Figure 2-14 • LVPECL Circuit Diagram and Board-Level Implementation

Table 2-86 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units

## I/O Register Specifications

### Fully Registered I/O Buffers with Synchronous Enable and Asynchronous Preset

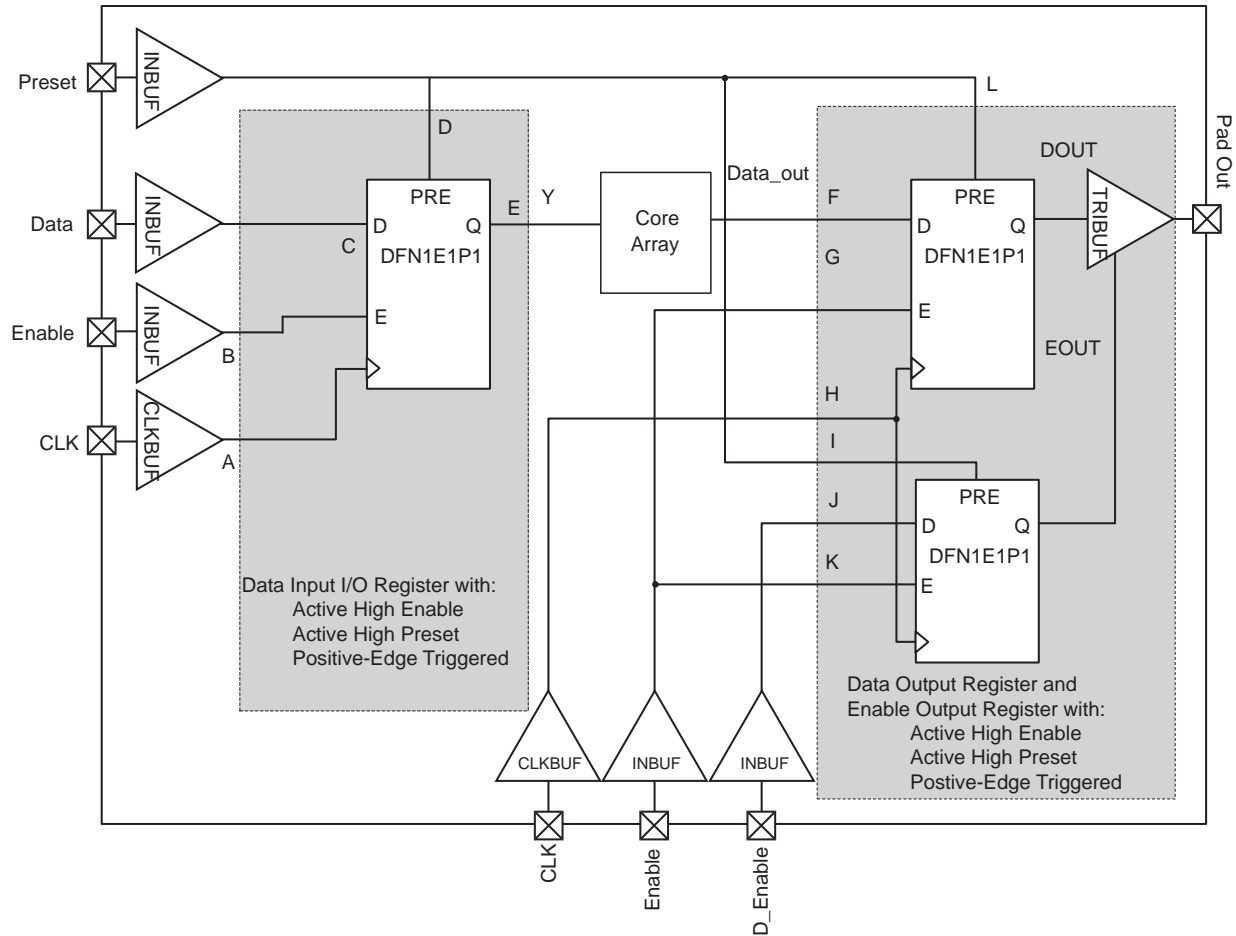

Figure 2-15 • Timing Model of Registered I/O Buffers with Synchronous Enable and Asynchronous Preset

**Table 2-90 • Parameter Definition and Measuring Nodes**

Parameter Name	Parameter Definition	Measuring Nodes (from, to)*
$t_{OCLKQ}$	Clock-to-Q of the Output Data Register	H, DOUT
$t_{OSUD}$	Data Setup Time for the Output Data Register	F, H
$t_{OHD}$	Data Hold Time for the Output Data Register	F, H
$t_{OSUE}$	Enable Setup Time for the Output Data Register	G, H
$t_{OHE}$	Enable Hold Time for the Output Data Register	G, H
$t_{OPRE2Q}$	Asynchronous Preset-to-Q of the Output Data Register	L, DOUT
$t_{OREMPRE}$	Asynchronous Preset Removal Time for the Output Data Register	L, H
$t_{ORECPRE}$	Asynchronous Preset Recovery Time for the Output Data Register	L, H
$t_{OECLKQ}$	Clock-to-Q of the Output Enable Register	H, EOUT
$t_{OESUD}$	Data Setup Time for the Output Enable Register	J, H
$t_{OEHD}$	Data Hold Time for the Output Enable Register	J, H
$t_{OESUE}$	Enable Setup Time for the Output Enable Register	K, H
$t_{OEHE}$	Enable Hold Time for the Output Enable Register	K, H
$t_{OEPRE2Q}$	Asynchronous Preset-to-Q of the Output Enable Register	I, EOUT
$t_{OEREMPRE}$	Asynchronous Preset Removal Time for the Output Enable Register	I, H
$t_{OERECPRE}$	Asynchronous Preset Recovery Time for the Output Enable Register	I, H
$t_{iCLKQ}$	Clock-to-Q of the Input Data Register	A, E
$t_{iSUD}$	Data Setup Time for the Input Data Register	C, A
$t_{iHD}$	Data Hold Time for the Input Data Register	C, A
$t_{iSUE}$	Enable Setup Time for the Input Data Register	B, A
$t_{iHE}$	Enable Hold Time for the Input Data Register	B, A
$t_{iPRE2Q}$	Asynchronous Preset-to-Q of the Input Data Register	D, E
$t_{iREMPRE}$	Asynchronous Preset Removal Time for the Input Data Register	D, A
$t_{iRECPRE}$	Asynchronous Preset Recovery Time for the Input Data Register	D, A

Note: \*See Figure 2-15 on page 2-53 for more information.

### Fully Registered I/O Buffers with Synchronous Enable and Asynchronous Clear

$F_{\text{DDOMAX}}$	Maximum Frequency for the Output DDR	TBD	TBD	MHz

*Note:* For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-5](#) for derating values.

# VersaTile Characteristics

## VersaTile Specifications as a Combinatorial Module

The ProASIC3 library offers all combinations of LUT-3 combinatorial functions. In this section, timing characteristics are presented for a sample of the library. For more details, refer to the *Fusion, IGL00/e, and ProASIC3/E Macro Library Guide*.

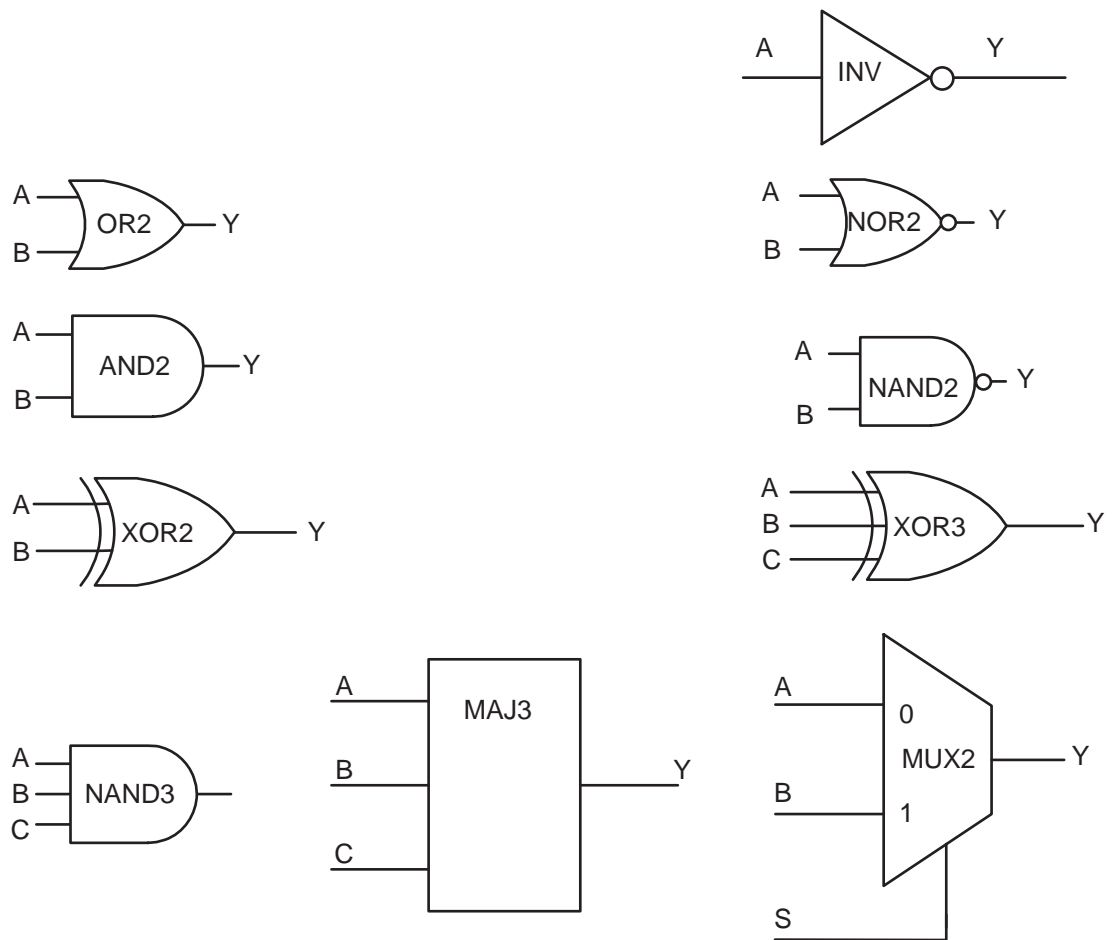

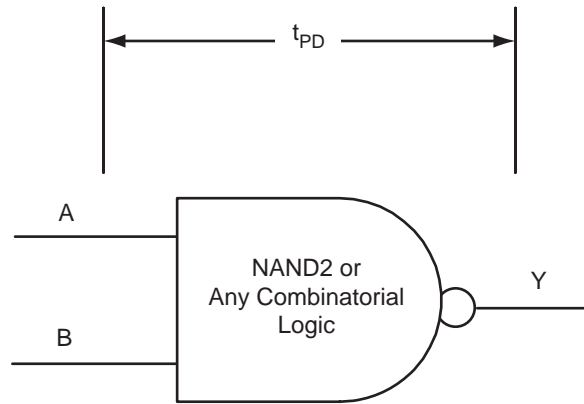

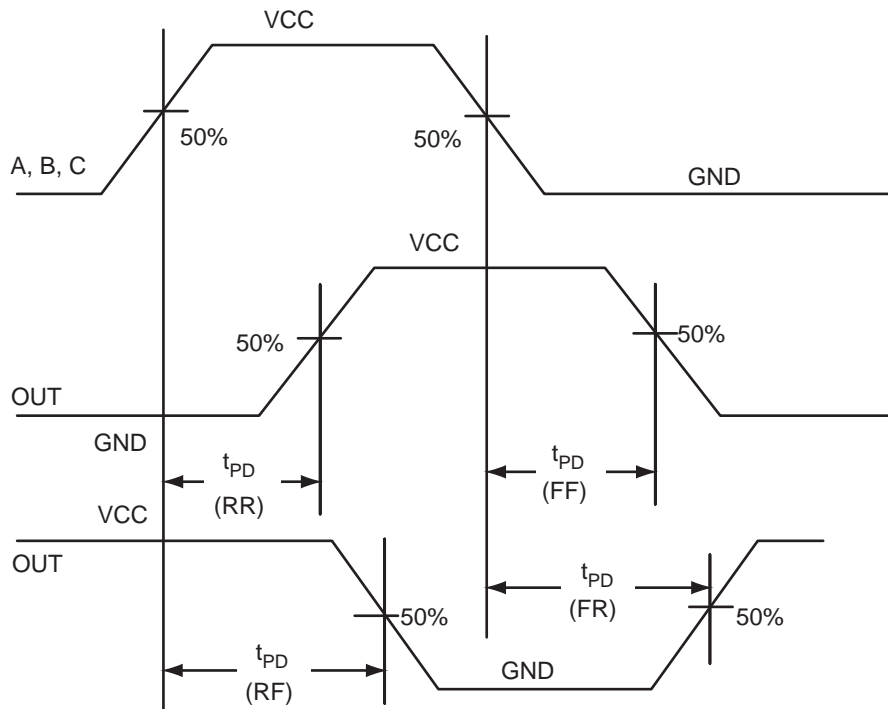

Figure 2-24 • Sample of Combinatorial Cells

$$t_{PD} = \text{MAX}(t_{PD(RR)}, t_{PD(RF)}, t_{PD(FF)}, t_{PD(FR)})$$

where edges are applicable for the particular combinatorial cell

**Figure 2-25 • Timing Model and Waveforms**

## Timing Characteristics

**Table 2-104 • Combinatorial Cell Propagation Delays**  
Automotive-Case Conditions:  $T_j = 135^\circ\text{C}$ , Worst-Case VCC = 1.425 V

Combinatorial Cell	Equation	Parameter	-1	Std.	Units
INV	$Y = !A$	$t_{PD}$	0.49	0.57	ns
AND2	$Y = A \cdot B$	$t_{PD}$	0.57	0.67	ns
NAND2	$Y = !(A \cdot B)$	$t_{PD}$	0.57	0.67	ns
OR2	$Y = A + B$	$t_{PD}$	0.59	0.69	ns

## VersaTile Specifications as a Sequential Module

The ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the [Fusion](#), [IGL00/e](#) and [ProASIC3/E Macro Library Guide](#).

**Figure 2-26 • Sample of Sequential Cells**

**Figure 2-27 • Timing Model and Waveforms**

### Timing Characteristics

**Table 2-106 • Register Delays**

 Automotive-Case Conditions:  $T_J = 135^{\circ}\text{C}$ , Worst-Case  $V_{CC} = 1.425\text{ V}$ 

Parameter	Description	-1	Std.	Units
$t_{CLKQ}$	Clock-to-Q of the Core Register	0.67	0.79	ns
$t_{SUD}$	Data Setup Time for the Core Register	0.52	0.61	ns
$t_{HD}$	Data Hold Time for the Core Register	0.00	0.00	ns
$t_{SUE}$	Enable Setup Time for the Core Register	0.55	0.65	ns
$t_{HE}$	Enable Hold Time for the Core Register	0.00	0.00	ns
$t_{CLR2Q}$	Asynchronous Clear-to-Q of the Core Register	0.49	0.57	ns
$t_{PRE2Q}$	Asynchronous Preset-to-Q of the Core Register	0.49	0.57	ns
$t_{REMCLR}$	Asynchronous Clear Removal Time for the Core Register	0.00	0.00	ns
$t_{RECCLR}$	Asynchronous Clear Recovery Time for the Core Register	0.27	0.32	ns
$t_{REMPRE}$	Asynchronous Preset Removal Time for the Core Register	0.00	0.00	ns
$t_{RECPRE}$	Asynchronous Preset Recovery Time for the Core Register	0.27	0.32	ns
$t_{WCLR}$	Asynchronous Clear Minimum Pulse Width for the Core Register	0.25	0.30	ns
$t_{WPRE}$	Asynchronous Preset Minimum Pulse Width for the Core Register	0.25	0.30	ns
$t_{CKMPWH}$	Clock Minimum Pulse Width High for the Core Register	0.41	0.48	ns
$t_{CKMPWL}$	Clock Minimum Pulse Width Low for the Core Register	0.37	0.43	ns

*Note:* For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-5](#) for derating values.

**Table 2-107 • Register Delays**
**Automotive-Case Conditions:  $T_J = 115^\circ\text{C}$ , Worst-Case  $V_{CC} = 1.425\text{ V}$** 

Parameter	Description	-1	Std.	Units
$t_{\text{CLKQ}}$	Clock-to-Q of the Core Register	0.66	0.77	ns
$t_{\text{SUD}}$	Data Setup Time for the Core Register	0.51	0.60	ns
$t_{\text{HD}}$	Data Hold Time for the Core Register	0.00	0.00	ns
$t_{\text{SUE}}$	Enable Setup Time for the Core Register	0.54	0.64	ns
$t_{\text{HE}}$	Enable Hold Time for the Core Register	0.00	0.00	ns
$t_{\text{CLR2Q}}$	Asynchronous Clear-to-Q of the Core Register	0.48	0.56	ns
$t_{\text{PRE2Q}}$	Asynchronous Preset-to-Q of the Core Register	0.48	0.56	ns
$t_{\text{REMCLR}}$	Asynchronous Clear Removal Time for the Core Register	0.00	0.00	ns
$t_{\text{RECLR}}$	Asynchronous Clear Recovery Time for the Core Register	0.27	0.31	ns
$t_{\text{REMPRE}}$	Asynchronous Preset Removal Time for the Core Register	0.00	0.00	ns
$t_{\text{RECPRE}}$	Asynchronous Preset Recovery Time for the Core Register	0.27	0.31	ns

$t_{\text{WPRE}}$	Asynchronous Preset Minimum Pulse Width for the Core Register	0.25	0.30	ns
$t_{\text{CKMPWH}}$	Clock Minimum Pulse Width High for the Core Register	0.41	0.48	ns
$t_{\text{CKMPWL}}$	Clock Minimum Pulse Width Low for the Core Register	0.37	0.43	ns

*Note:* For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-5](#) for derating values.

## Global Resource Characteristics

### A3P250 Clock Tree Topology

Clock delays are device-specific. [Figure 2-28](#) is an example of a global tree used for clock routing. The global tree presented in [Figure 2-28](#) is driven by a CCC located on the west side of the A3P250 device. It is used to drive all D-flip-flops in the device.

**Figure 2-28 • Example of Global Tree Use in an A3P250 Device for Clock Routing**

## Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-80. Table 2-114 on page 2-79 to Table 2-125 on page 2-97 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

### Timing Characteristics

**Table 2-108 • A3P060 Global Resource**
**Commercial-Case Conditions:  $T_J = 135^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$** 

Parameter	Description	-1		Std.		Units
		Min. <sup>1</sup>	Max. <sup>2</sup>	Min. <sup>1</sup>	Max. <sup>2</sup>	
$t_{RCKL}$	Input Low Delay for Global Clock	0.87	1.16	1.02	1.37	ns
$t_{RCKH}$	Input High Delay for Global Clock	0.86	1.20	1.01	1.42	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns
$t_{RCKSW}$	Maximum Skew for Global Clock		0.35		0.41	ns
$F_{RMAX}$	Maximum Frequency for Global Clock					MHz

**Notes:**

- Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
- Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
- For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-5 for derating values.

**Table 2-109 • A3P060 Global Resource**
**Commercial-Case Conditions:  $T_J = 115^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$** 

Parameter	Description	-1		Std.		Units
		Min. <sup>1</sup>	Max. <sup>2</sup>	Min. <sup>1</sup>	Max. <sup>2</sup>	
$t_{RCKL}$	Input Low Delay for Global Clock	0.85	1.13	1.00	1.33	ns
$t_{RCKH}$	Input High Delay for Global Clock	0.84	1.18	0.99	1.38	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns
$t_{RCKSW}$	Maximum Skew for Global Clock		0.34		0.40	ns
$F_{RMAX}$	Maximum Frequency for Global Clock					MHz

**Notes:**

- Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
- Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
- For specific junction temperature and voltage supply levels, refer to Table 2-5 on page 2-5 for derating values.

**Table 2-110 • A3P125 Global Resource**  
 Commercial-Case Conditions:  $T_J = 135^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. <sup>1</sup>	Max. <sup>2</sup>	Min. <sup>1</sup>	Max. <sup>2</sup>	
$t_{RCKL}$	Input Low Delay for Global Clock	0.93	1.22	1.09	1.43	ns
$t_{RCKH}$	Input High Delay for Global Clock	0.92	1.26	1.08	1.49	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns
$t_{RCKSW}$	Maximum Skew for Global Clock		0.35		0.41	ns
$F_{RMAX}$	Maximum Frequency for Global Clock					MHz

**Notes:**

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-5 on page 2-5](#) for derating values.

**Table 2-111 • A3P125 Global Resource**  
 Commercial-Case Conditions:  $T_J = 115^\circ\text{C}$ ,  $V_{CC} = 1.425\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. <sup>1</sup>	Max. <sup>2</sup>	Min. <sup>1</sup>	Max. <sup>2</sup>	
$t_{RCKL}$	Input Low Delay for Global Clock	0.90	1.19	1.06	1.40	ns
$t_{RCKH}$	Input High Delay for Global Clock	0.90	1.23	1.05	1.45	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock					ns

## Clock Conditioning Circuits

### CCC Electrical Specifications

#### Timing Characteristics

**Table 2-116 • Automotive ProASIC3 CCC/PLL Specification**

Parameter	Minimum	Typical	Maximum	Units
Clock Conditioning Circuitry Input Frequency $f_{IN\_CCC}$	1.5		350	MHz
Clock Conditioning Circuitry Output Frequency $f_{OUT\_CCC}$	0.75		350	MHz
Delay Increments in Programmable Delay Blocks <sup>1, 2</sup>		160 <sup>3</sup>		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Input Period Jitter			1.5	ns
CCC Output Peak-to-Peak Period Jitter $F_{CCC\_OUT}$	Max Peak-to-Peak Period Jitter			
	1 Global Network Used		3 Global Networks Used	
0.75 MHz to 24 MHz	0.50%		0.70%	
24 MHz to 100 MHz	1.00%		1.20%	
100 MHz to 250 MHz	1.75%		2.00%	
250 MHz to 350 MHz	2.50%		5.60%	
Acquisition Time				
(A3P250 and A3P1000 only)	LockControl = 0		300	$\mu$ s
	LockControl = 1		300	$\mu$ s
(all other dies)	LockControl = 0		300	$\mu$ s
	LockControl = 1		6.0	ms
Tracking Jitter <sup>4</sup>				
(A3P250 and A3P1000 only)	LockControl = 0		1.6	ns
	LockControl = 1		1.6	ns
(all other dies)	LockControl = 0		1.6	ns
	LockControl = 1		0.8	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 <sup>1, 2</sup>	0.6		5.56	ns
Delay Range in Block: Programmable Delay 2 <sup>1, 2</sup>	0.025		5.56	ns
Delay Range in Block: Fixed Delay <sup>1, 2</sup>		2.2		ns

**Notes:**

1. This delay is a function of voltage and temperature. See [Table 2-5 on page 2-5](#) for deratings.
2.  $T_J = 25^\circ\text{C}$ ,  $V_{CC} = 1.5\text{ V}$
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to SmartGen online help for more information.
4. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.

*Note:* Peak-to-peak jitter measurements are defined by  $T_{\text{peak-to-peak}} = T_{\text{period\_max}} - T_{\text{period\_min}}$ .

---

## 3 – Pin Descriptions and Packaging

---

### Supply Pins

**GND****Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

**GNDQ****Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

**VCC****Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

**VCCIBx****I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to four I/O banks on Automotive ProASIC3 devices, plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VCCI pins tied to GND.

**VMVx****I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

**VCCPLA/B/C/D/E/F****PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V.

When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the *Automotive ProASIC3 FPGA Fabric User's Guide* for a complete board solution for the PLL analog power supply and ground.

There is one VCCPLF pin on Automotive ProASIC3 devices.

**VCOMPLA/B/C/D/E/F****PLL Ground**

Ground to analog PLL power supplies. When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on Automotive ProASIC3 devices.

**VJTAG****JTAG Supply Voltage**

Automotive ProASIC3 devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to

GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

### **VPUMP Programming Supply Voltage**

Automotive ProASIC3 devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01  $\mu\text{F}$  and 0.33  $\mu\text{F}$  capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

## User Pins

### **I/O User Input/Output**

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

### **GL Globals**

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the *Automotive ProASIC3 FPGA Fabric User's Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Refer to the "I/O Structures in IGLOO and ProASIC3 Devices" chapter of the *Automotive ProASIC3 FPGA Fabric User's Guide* for an explanation of the naming of global pins.

## JTAG Pins

Automotive ProASIC3 devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

### **TCK** **Test Clock**

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/down resistor. If JTAG is not used, Actel recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500  $\Omega$  to 1 k $\Omega$  will satisfy the requirements. Refer to [Table 3-1](#) for more information.

**Table 3-1 • Recommended Tie-Off Values for the TCK and TRST Pins**

VJTAG	Tie-Off Resistance
VJTAG at 3.3 V	200 $\Omega$ to 1 k $\Omega$
VJTAG at 2.5 V	200 $\Omega$ to 1 k $\Omega$
VJTAG at 1.8 V	500 $\Omega$ to 1 k $\Omega$
VJTAG at 1.5 V	500 $\Omega$ to 1 k $\Omega$

*Notes:*

1. Equivalent parallel resistance if more than one device is on the JTAG chain
2. The TCK pin can be pulled up/down.
3. The TRST pin is pulled down.

### **TDI** **Test Data Input**

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

### **TDO** **Test Data Output**

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

### **TMS** **Test Mode Select**

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

### **TRST** **Boundary Scan Reset Pin**

The TRST pin functions as an active-low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from [Table 3-1](#) and must satisfy the parallel resistance value requirement. The values in [Table 3-1](#) correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Actel recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500  $\Omega$  to 1 k $\Omega$  will satisfy the requirements.

## Special Function Pins

**NC**

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

**No Connect****DC**

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

**Do Not Connect**

## Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Actel offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.

## 5 – Datasheet Information

### List of Changes

The following table lists critical changes that were made in each revision of the Automotive ProASIC3 datasheet.

Revision	Changes	Page
Revision3 (September 2012)	The "Security" section was modified to clarify that Microsemi does not support read-back of programmed data.	1-1
Revision 2 (May 2012)	The "Extended Temperature AEC-Q100–Qualified Devices" section was modified to include the low end of the temperature range, –40°C, for Grade 1 and Grade 2 AEC-Q100 qualified devices (SAR 34915).	I
	The "In-System Programming (ISP) and Security" section and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34674).	I, 1-1
	The Y security option and Licensed DPA Logo were added to the "Automotive ProASIC3 Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34719).	III
	A note defining $T_A$ and $T_J$ was added to the "Automotive ProASIC3 Ordering Information" section (SAR 37547).	III
	The following sentence was deleted from the "Advanced Architecture" section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of Automotive ProASIC3 devices via an IEEE 1532 JTAG interface" (SAR 34682).	1-3
	In Table 2-2 • Recommended Operating Conditions, VCCPLL analog power supply (PLL) was changed from "1.4 to 1.6" to "1.425 to 1.575" (SAR 34718).	2-2
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—PCLOCK" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the <i>Automotive ProASIC3 FPGA Fabric User's Guide</i> (SAR 34738).	2-10
	$t_{DOUT}$ was corrected to $t_{DIN}$ in Figure 2-4 • Input Buffer Timing Model and Delays (example) (SAR 37111).	2-13
	The equations in the notes for Table 2-27 • I/O Weak Pull-Up/Pull-Down Resistances were corrected (SAR 34754).	2-23
	The AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match tables in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section (SAR 34882).	2-27
	The following sentence was deleted from the "2.5 V LVCMOS" section (SAR 34795): "It uses a 5 V–tolerant input buffer and push-pull output buffer."	2-33
The table notes for Table 2-82 • Minimum and Maximum DC Input and Output Levels were not necessary and were removed (SAR 34811).	2-50	

Revision	Changes	Page
Revision 2 (continued)	The following figures were deleted (SAR 29991). Reference was made to a new application note, <i>Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs</i> , which covers these cases in detail (SAR 34861). Figure 2-35 • Write Access after Write to Same Address Figure 2-36 • Read Access after Write to Same Address Figure 2-35 • Read Access after Write to Same Address The port names in the SRAM "Timing Waveforms", SRAM "Timing Characteristics" tables, Figure 2-39 • FIFO Reset, and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SAR 35744).	2-83, 2-86, 2-92, 2-94
	Figure 2-37 • FIFO Read and Figure 2-38 • FIFO Write are new (SAR 34838).	2-91
	Table 2-116 • Automotive ProASIC3 CCC/PLL Specification was updated. A note was added to indicate that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34822).	2-80
	The "Pin Descriptions and Packaging" chapter has been added (SAR 34767),	3-1
	The "VQ100" pin table for A3P125 has been added (SAR 37944).	4-3
	Package names used in the "Package Pin Assignments" section were revised to match standards given in <i>Package Mechanical Drawings</i> (SAR 34767).	4-1
July 2010	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "Automotive ProASIC3 Device Status" table on page II indicates the status for each device in the device family.	N/A

Revision	Changes	Page
<b>Revision 1 (Dec 2009)</b> Product Brief v1.1	The QNG132 package was added to the "Automotive ProASIC3 Product Family" table, "I/Os Per Package" table, "Automotive ProASIC3 Ordering Information", and "Temperature Grade Offerings".	I – IV
Packaging v1.1	Pin tables for A3P125 and A3P250 were added for the "QN132" package.	4-6

## Datasheet Categories

### **Categories**

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "Automotive ProASIC3 Device Status" table on page II, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

#### **Product Brief**

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

#### **Advance**

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

#### **Preliminary**

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

#### **Production**

This version contains information that is considered to be final.

### **Export Administration Regulations (EAR)**

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

## Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at [http://www.microsemi.com/soc/documents/ORT\\_Report.pdf](http://www.microsemi.com/soc/documents/ORT_Report.pdf). Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.

Microsemi Corporation (NASDAQ: MSCC) offers a comprehensive portfolio of semiconductor solutions for: aerospace, defense and security; enterprise and communications; and industrial and alternative energy markets. Products include high-performance, high-reliability analog and RF devices, mixed signal and RF integrated circuits, customizable SoCs, FPGAs, and complete subsystems. Microsemi is headquartered in Aliso Viejo, Calif. Learn more at [www.microsemi.com](http://www.microsemi.com).
